Release 1.0

Dominik Liebler and contributors

February 02, 2017

1	Patterns	3
1.1	Creational	3
1.1.1	Abstract Factory	3
1.1.2	Builder	6
1.1.3	Factory Method	11
1.1.4	Multiton	16
1.1.5	Pool	17
1.1.6	Prototype	20
1.1.7	Simple Factory	23
1.1.8	Singleton	25
1.1.9	Static Factory	27
1.2	Structural	30
1.2.1	Adapter / Wrapper	30
1.2.2	Bridge	36
1.2.3	Composite	38
1.2.4	Data Mapper	41
1.2.5	Decorator	45
1.2.6	Dependency Injection	48
1.2.7	Facade	53
1.2.8	Fluent Interface	56
1.2.9	Flyweight	58
1.2.10	Proxy	61
1.2.11	Registry	64
1.3	Behavioral	66
1.3.1	Chain Of Responsibilities	66
1.3.2	Command	69
1.3.3	Iterator	73
1.3.4	Mediator	78
1.3.5	Memento	82
1.3.6	Null Object	86
1.3.7	Observer	89
1.3.8	Specification	92
1.3.9	State	97
1.3.10	Strategy	101
1.3.11	Template Method	105
1.3.12	Visitor	108
1.4	More	112
1.4.1	Delegation	112

1.4.2	Service Locator	114
1.4.3	Repository	118
1.4.4	Entity-Attribute-Value (EAV)	123
2	Contribute	129
3	License	131

This is a collection of known [design patterns](#) and some sample code how to implement them in PHP. Every pattern has a small list of examples (most of them from Zend Framework, Symfony2 or Doctrine2 as I'm most familiar with this software).

I think the problem with patterns is that often people do know them but don't know when to apply which.

Patterns

The patterns can be structured in roughly three different categories. Please click on **the title of every pattern's page** for a full explanation of the pattern on Wikipedia.

1.1 Creational

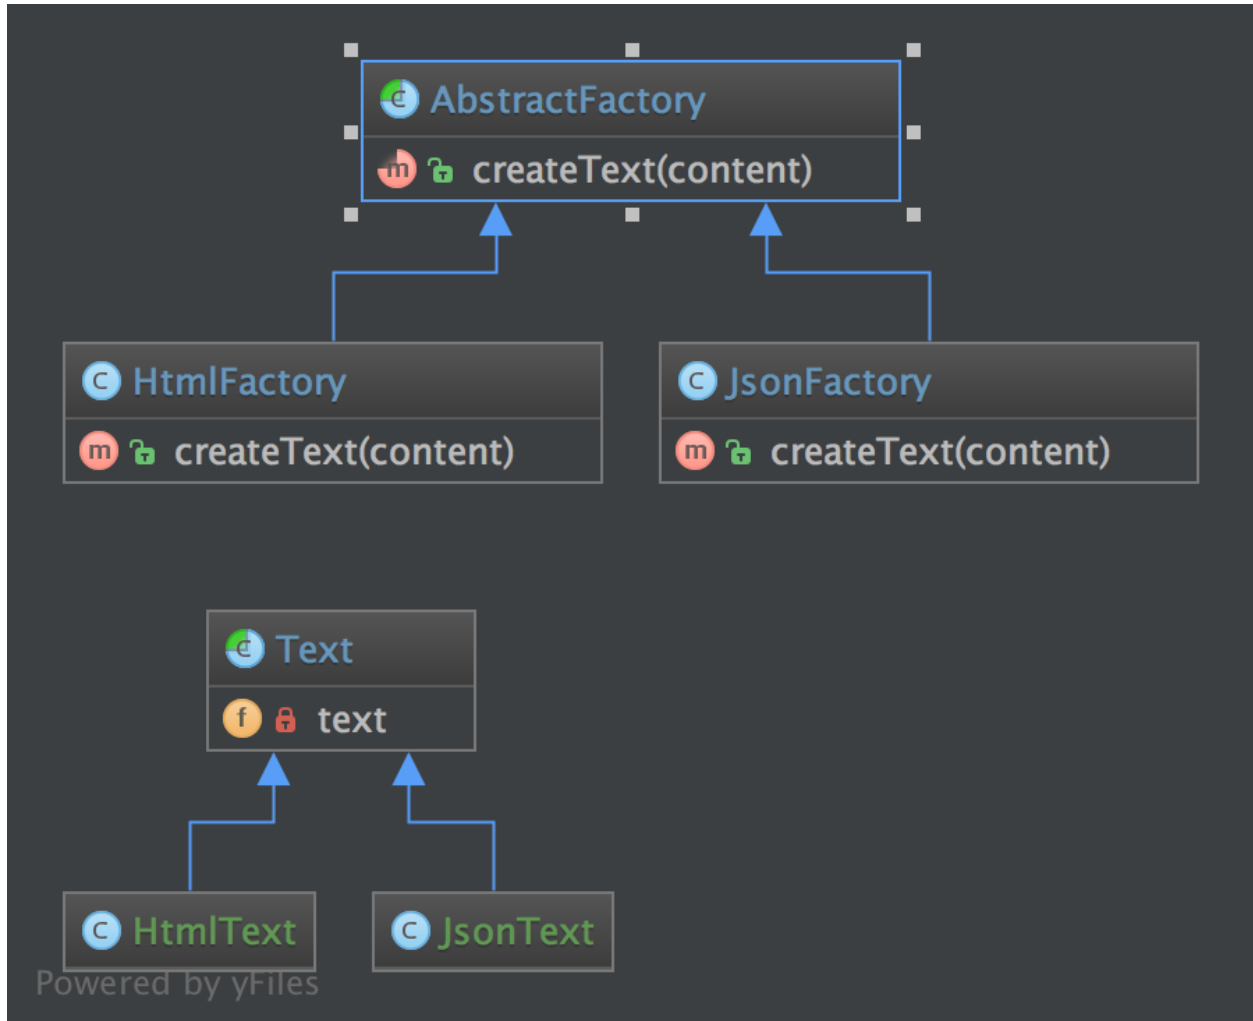

In software engineering, creational design patterns are design patterns that deal with object creation mechanisms, trying to create objects in a manner suitable to the situation. The basic form of object creation could result in design problems or added complexity to the design. Creational design patterns solve this problem by somehow controlling this object creation.

1.1.1 Abstract Factory

Purpose

To create series of related or dependent objects without specifying their concrete classes. Usually the created classes all implement the same interface. The client of the abstract factory does not care about how these objects are created, he just knows how they go together.

Code

You can also find these code on [GitHub](#)

AbstractFactory.php

```

1  <?php
2
3  namespace DesignPatterns\Creational\AbstractFactory;
4
5  /**
6   * In this case, the abstract factory is a contract for creating some components
7   * for the web. There are two ways of rendering text: HTML and JSON
8   */
9  abstract class AbstractFactory
10 {
11     abstract public function createText(string $content): Text;
12 }
  
```

JsonFactory.php

```
1 <?php
2
3 namespace DesignPatterns\Creational\AbstractFactory;
4
5 class JsonFactory extends AbstractFactory
6 {
7     public function createText(string $content): Text
8     {
9         return new JsonText($content);
10    }
11 }
```

HtmlFactory.php

```
1 <?php
2
3 namespace DesignPatterns\Creational\AbstractFactory;
4
5 class HtmlFactory extends AbstractFactory
6 {
7     public function createText(string $content): Text
8     {
9         return new HtmlText($content);
10    }
11 }
```

Text.php

```
1 <?php
2
3 namespace DesignPatterns\Creational\AbstractFactory;
4
5 abstract class Text
6 {
7     /**
8      * @var string
9      */
10    private $text;
11
12    public function __construct(string $text)
13    {
14        $this->text = $text;
15    }
16 }
```

JsonText.php

```
1 <?php
2
3 namespace DesignPatterns\Creational\AbstractFactory;
4
5 class JsonText extends Text
6 {
7     // do something here
8 }
```

HtmlText.php

```
1 <?php
2
3 namespace DesignPatterns\Creational\AbstractFactory;
4
5 class HtmlText extends Text
6 {
7     // do something here
8 }
```

Test

Tests/AbstractFactoryTest.php

```
1 <?php
2
3 namespace DesignPatterns\Creational\AbstractFactory\Tests;
4
5 use DesignPatterns\Creational\AbstractFactory\HtmlFactory;
6 use DesignPatterns\Creational\AbstractFactory\JsonFactory;
7
8 class AbstractFactoryTest extends \PHPUnit_Framework_TestCase
9 {
10     public function testCanCreateHtmlText ()
11     {
12         $factory = new HtmlFactory();
13         $text = $factory->createText('foobar');
14
15         $this->assertInstanceOf('DesignPatterns\Creational\AbstractFactory\HtmlText', $text);
16     }
17
18     public function testCanCreateJsonText ()
19     {
20         $factory = new JsonFactory();
21         $text = $factory->createText('foobar');
22
23         $this->assertInstanceOf('DesignPatterns\Creational\AbstractFactory\JsonText', $text);
24     }
25 }
```

1.1.2 Builder

Purpose

Builder is an interface that build parts of a complex object.

Sometimes, if the builder has a better knowledge of what it builds, this interface could be an abstract class with default methods (aka adapter).

If you have a complex inheritance tree for objects, it is logical to have a complex inheritance tree for builders too.

Note: Builders have often a fluent interface, see the mock builder of PHPUnit for example.

Examples

- PHPUnit: Mock Builder

UML Diagram

Code

You can also find these code on [GitHub](#)

Director.php

```

1  <?php
2
3  namespace DesignPatterns\Creational\Builder;
4
5  use DesignPatterns\Creational\Builder\Parts\Vehicle;
6
7  /**
8   * Director is part of the builder pattern. It knows the interface of the builder
9   * and builds a complex object with the help of the builder
10  *
11  * You can also inject many builders instead of one to build more complex objects
12  */
13  class Director
14  {
15      public function build(BuilderInterface $builder): Vehicle
16      {
17          $builder->createVehicle();
18          $builder->addDoors();
19          $builder->addEngine();
20          $builder->addWheel();
21
22          return $builder->getVehicle();
23      }
24  }
  
```

BuilderInterface.php

```

1  <?php
2
  
```

```
3 namespace DesignPatterns\Creational\Builder;
4
5 use DesignPatterns\Creational\Builder\Parts\Vehicle;
6
7 interface BuilderInterface
8 {
9     public function createVehicle();
10
11     public function addWheel();
12
13     public function addEngine();
14
15     public function addDoors();
16
17     public function getVehicle(): Vehicle;
18 }
```

TruckBuilder.php

```
1 <?php
2
3 namespace DesignPatterns\Creational\Builder;
4
5 use DesignPatterns\Creational\Builder\Parts\Vehicle;
6
7 class TruckBuilder implements BuilderInterface
8 {
9     /**
10      * @var Parts\Truck
11      */
12     private $truck;
13
14     public function addDoors()
15     {
16         $this->truck->setPart('rightDoor', new Parts\Door());
17         $this->truck->setPart('leftDoor', new Parts\Door());
18     }
19
20     public function addEngine()
21     {
22         $this->truck->setPart('truckEngine', new Parts\Engine());
23     }
24
25     public function addWheel()
26     {
27         $this->truck->setPart('wheel1', new Parts\Wheel());
28         $this->truck->setPart('wheel2', new Parts\Wheel());
29         $this->truck->setPart('wheel3', new Parts\Wheel());
30         $this->truck->setPart('wheel4', new Parts\Wheel());
31         $this->truck->setPart('wheel5', new Parts\Wheel());
32         $this->truck->setPart('wheel6', new Parts\Wheel());
33     }
34
35     public function createVehicle()
36     {
37         $this->truck = new Parts\Truck();
38     }
39
40     public function getVehicle(): Vehicle
```

```

41     {
42         return $this->truck;
43     }
44 }

```

CarBuilder.php

```

1  <?php
2
3  namespace DesignPatterns\Creational\Builder;
4
5  use DesignPatterns\Creational\Builder\Parts\Vehicle;
6
7  class CarBuilder implements BuilderInterface
8  {
9      /**
10       * @var Parts\Car
11       */
12     private $car;
13
14     public function addDoors()
15     {
16         $this->car->setPart('rightDoor', new Parts\Door());
17         $this->car->setPart('leftDoor', new Parts\Door());
18         $this->car->setPart('trunkLid', new Parts\Door());
19     }
20
21     public function addEngine()
22     {
23         $this->car->setPart('engine', new Parts\Engine());
24     }
25
26     public function addWheel()
27     {
28         $this->car->setPart('wheelLF', new Parts\Wheel());
29         $this->car->setPart('wheelRF', new Parts\Wheel());
30         $this->car->setPart('wheelLR', new Parts\Wheel());
31         $this->car->setPart('wheelRR', new Parts\Wheel());
32     }
33
34     public function createVehicle()
35     {
36         $this->car = new Parts\Car();
37     }
38
39     public function getVehicle(): Vehicle
40     {
41         return $this->car;
42     }
43 }

```

Parts/Vehicle.php

```

1  <?php
2
3  namespace DesignPatterns\Creational\Builder\Parts;
4
5  abstract class Vehicle
6  {

```

```
7  /**
8   * @var object[]
9   */
10 private $data = [];
11
12 /**
13  * @param string $key
14  * @param object $value
15  */
16 public function setPart($key, $value)
17 {
18     $this->data[$key] = $value;
19 }
20 }
```

Parts/Truck.php

```
1  <?php
2
3  namespace DesignPatterns\Creational\Builder\Parts;
4
5  class Truck extends Vehicle
6  {
7  }
```

Parts/Car.php

```

4
5  class Car extends Vehicle
6  {
7  }
```

Parts/Engine.php

```
1  <?php
2
3  namespace DesignPatterns\Creational\Builder\Parts;
4
5  class Engine
6  {
7  }
```

Parts/Wheel.php

```
1  <?php
2
3  namespace DesignPatterns\Creational\Builder\Parts;
4
5  class Wheel
6  {
7  }
```

Parts/Door.php

```
1  <?php
2
3  namespace DesignPatterns\Creational\Builder\Parts;
```

```

4
5 class Door
6 {
7 }

```

Test

Tests/DirectorTest.php

```

1 <?php
2
3 namespace DesignPatterns\Creational\Builder\Tests;
4
5 use DesignPatterns\Creational\Builder\TruckBuilder;
6 use DesignPatterns\Creational\Builder\CarBuilder;
7 use DesignPatterns\Creational\Builder\Director;
8
9 class DirectorTest extends \PHPUnit_Framework_TestCase
10 {
11     public function testCanBuildTruck()
12     {
13         $truckBuilder = new TruckBuilder();
14         $newVehicle = (new Director())->build($truckBuilder);
15
16         $this->assertInstanceOf('DesignPatterns\Creational\Builder\Parts\Truck', $newVehicle);
17     }
18
19     public function testCanBuildCar()
20     {
21         $carBuilder = new CarBuilder();
22         $newVehicle = (new Director())->build($carBuilder);
23
24         $this->assertInstanceOf('DesignPatterns\Creational\Builder\Parts\Car', $newVehicle);
25     }
26 }

```

1.1.3 Factory Method

Purpose

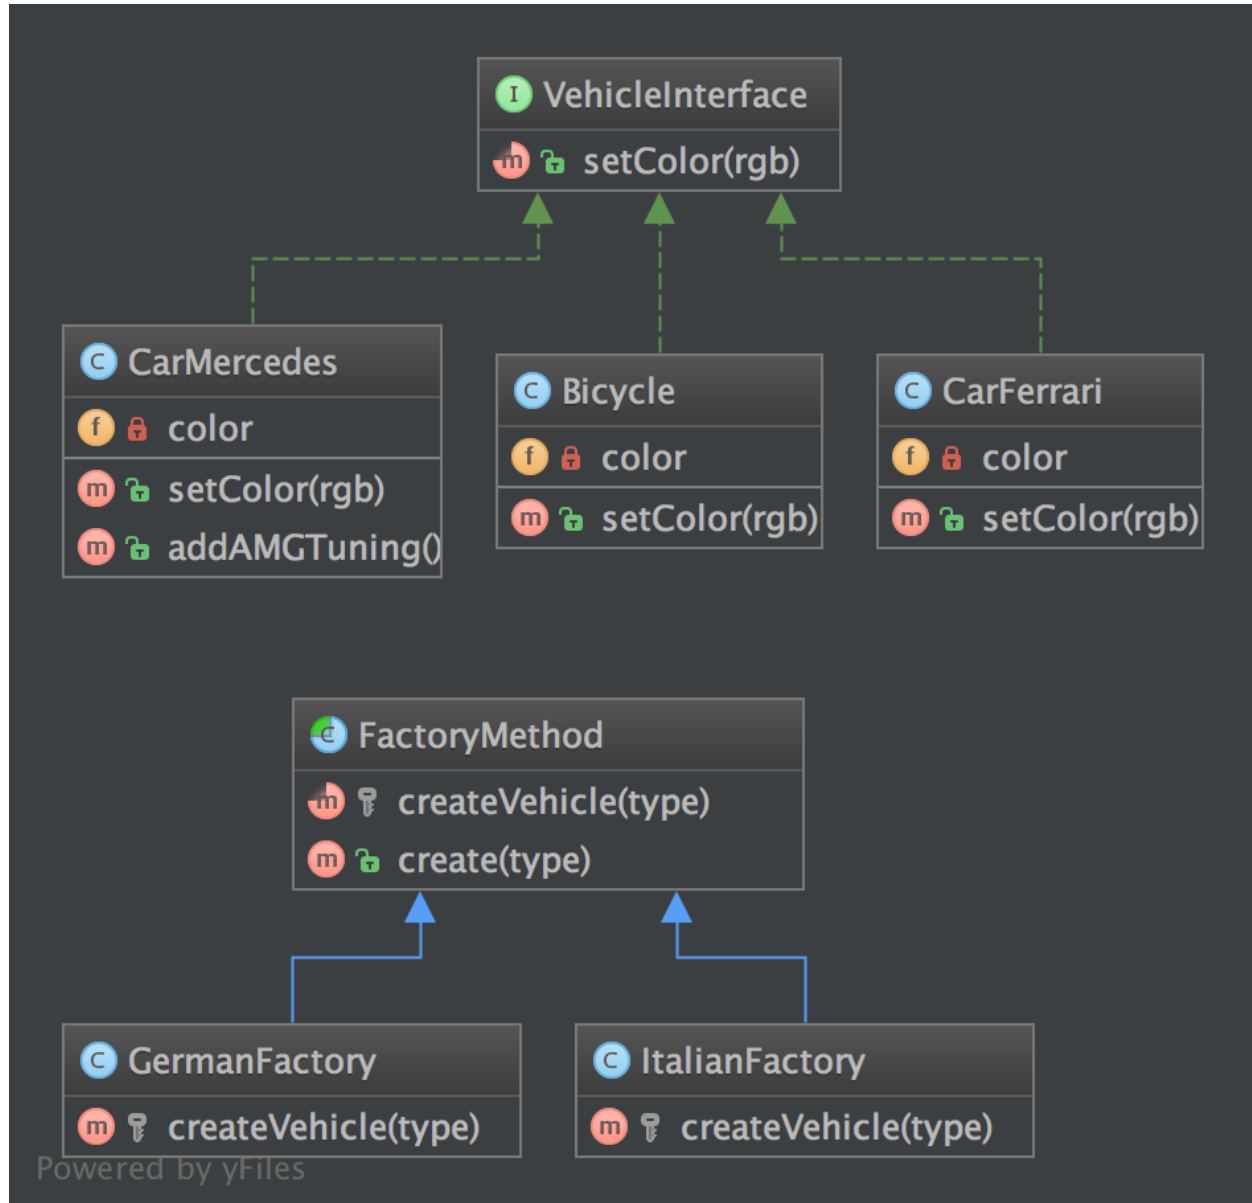

The good point over the SimpleFactory is you can subclass it to implement different ways to create objects

For simple case, this abstract class could be just an interface

This pattern is a “real” Design Pattern because it achieves the “Dependency Inversion Principle” a.k.a the “D” in S.O.L.I.D principles.

It means the FactoryMethod class depends on abstractions, not concrete classes. This is the real trick compared to SimpleFactory or StaticFactory.

UML Diagram

Code

You can also find these code on [GitHub](#)

FactoryMethod.php

```

1  <?php
2
3  namespace DesignPatterns\Creational\FactoryMethod;
4
5  abstract class FactoryMethod
6  {
7      const CHEAP = 'cheap';
  
```

```

8     const FAST = 'fast';
9
10    abstract protected function createVehicle(string $type): VehicleInterface;
11
12    public function create(string $type): VehicleInterface
13    {
14        $obj = $this->createVehicle($type);
15        $obj->setColor('black');
16
17        return $obj;
18    }
19 }

```

ItalianFactory.php

```

1 <?php
2
3 namespace DesignPatterns\Creational\FactoryMethod;
4
5 class ItalianFactory extends FactoryMethod
6 {
7     protected function createVehicle(string $type): VehicleInterface
8     {
9         switch ($type) {
10             case parent::CHEAP:
11                 return new Bicycle();
12             case parent::FAST:
13                 return new CarFerrari();
14             default:
15                 throw new \InvalidArgumentException("$type is not a valid vehicle");
16         }
17     }
18 }

```

GermanFactory.php

```

1 <?php
2
3 namespace DesignPatterns\Creational\FactoryMethod;
4
5 class GermanFactory extends FactoryMethod
6 {
7     protected function createVehicle(string $type): VehicleInterface
8     {
9         switch ($type) {
10             case parent::CHEAP:
11                 return new Bicycle();
12             case parent::FAST:
13                 $carMercedes = new CarMercedes();
14                 // we can specialize the way we want some concrete Vehicle since we know the class
15                 $carMercedes->addAMGTuning();
16
17                 return $carMercedes;
18             default:
19                 throw new \InvalidArgumentException("$type is not a valid vehicle");
20         }
21     }
22 }

```

VehicleInterface.php

```
1 <?php
2
3 namespace DesignPatterns\Creational\FactoryMethod;
4
5 interface VehicleInterface
6 {
7     public function setColor(string $rgb);
8 }
```

CarMercedes.php

```
1 <?php
2
3 namespace DesignPatterns\Creational\FactoryMethod;
4
5 class CarMercedes implements VehicleInterface
6 {
7     /**
8      * @var string
9      */
10    private $color;
11
12    public function setColor(string $rgb)
13    {
14        $this->color = $rgb;
15    }
16
17    public function addAMGTuning()
18    {
19        // do additional tuning here
20    }
21 }
```

CarFerrari.php

```
1 <?php
2
3 namespace DesignPatterns\Creational\FactoryMethod;
4
5 class CarFerrari implements VehicleInterface
6 {
7     /**
8      * @var string
9      */
10    private $color;
11
12    public function setColor(string $rgb)
13    {
14        $this->color = $rgb;
15    }
16 }
```

Bicycle.php

```
1 <?php
2
3 namespace DesignPatterns\Creational\FactoryMethod;
4
```

```

5 class Bicycle implements VehicleInterface
6 {
7     /**
8      * @var string
9      */
10    private $color;
11
12    public function setColor(string $rgb)
13    {
14        $this->color = $rgb;
15    }
16 }

```

Test

Tests/FactoryMethodTest.php

```

1  <?php
2
3  namespace DesignPatterns\Creational\FactoryMethod\Tests;
4
5  use DesignPatterns\Creational\FactoryMethod\FactoryMethod;
6  use DesignPatterns\Creational\FactoryMethod\GermanFactory;
7  use DesignPatterns\Creational\FactoryMethod\ItalianFactory;
8
9  class FactoryMethodTest extends \PHPUnit_Framework_TestCase
10 {
11     public function testCanCreateCheapVehicleInGermany()
12     {
13         $factory = new GermanFactory();
14         $result = $factory->create(FactoryMethod::CHEAP);
15
16         $this->assertInstanceOf('DesignPatterns\Creational\FactoryMethod\Bicycle', $result);
17     }
18
19     public function testCanCreateFastVehicleInGermany()
20     {
21         $factory = new GermanFactory();
22         $result = $factory->create(FactoryMethod::FAST);
23
24         $this->assertInstanceOf('DesignPatterns\Creational\FactoryMethod\CarMercedes', $result);
25     }
26
27     public function testCanCreateCheapVehicleInItaly()
28     {
29         $factory = new ItalianFactory();
30         $result = $factory->create(FactoryMethod::CHEAP);
31
32         $this->assertInstanceOf('DesignPatterns\Creational\FactoryMethod\Bicycle', $result);
33     }
34
35     public function testCanCreateFastVehicleInItaly()
36     {
37         $factory = new ItalianFactory();
38         $result = $factory->create(FactoryMethod::FAST);
39
40         $this->assertInstanceOf('DesignPatterns\Creational\FactoryMethod\CarFerrari', $result);

```

```
41     }
42
43     /**
44      * @expectedException \InvalidArgumentException
45      * @expectedExceptionMessage spaceship is not a valid vehicle
46      */
47     public function testUnknownType()
48     {
49         (new ItalianFactory())->create('spaceship');
50     }
51 }
```

1.1.4 Multiton

THIS IS CONSIDERED TO BE AN ANTI-PATTERN! FOR BETTER TESTABILITY AND MAINTAINABILITY USE DEPENDENCY INJECTION!

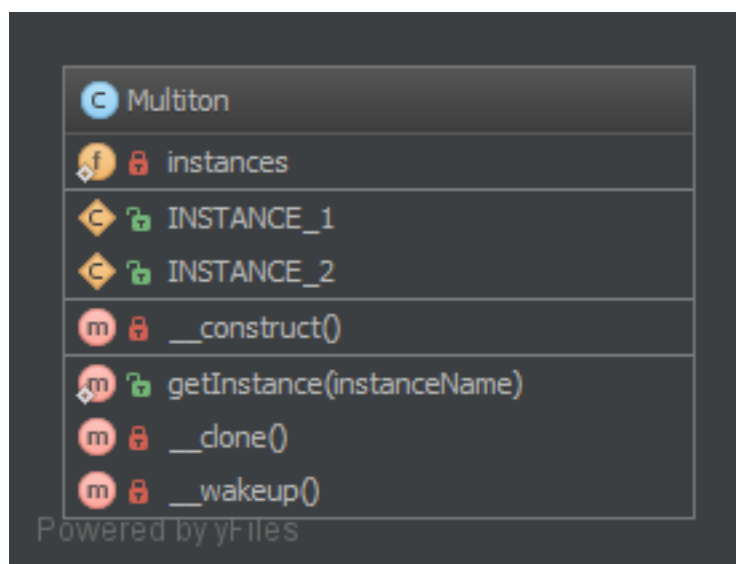

Purpose

To have only a list of named instances that are used, like a singleton but with n instances.

Examples

- 2 DB Connectors, e.g. one for MySQL, the other for SQLite
- multiple Loggers (one for debug messages, one for errors)

UML Diagram

Code

You can also find these code on [GitHub](#)

Multiton.php

```

1  <?php
2
3  namespace DesignPatterns\Creational\Multiton;
4
5  class Multiton
6  {
7      const INSTANCE_1 = '1';
8      const INSTANCE_2 = '2';
9
10     /**
11      * @var Multiton[]
12      */
13     private static $instances = [];
14
15     /**
16      * this is private to prevent from creating arbitrary instances
17      */
18     private function __construct()
19     {
20     }
21
22     public static function getInstance(string $instanceName): Multiton
23     {
24         if (!isset(self::$instances[$instanceName])) {
25             self::$instances[$instanceName] = new self();
26         }
27
28         return self::$instances[$instanceName];
29     }
30
31     /**
32      * prevent instance from being cloned
33      */
34     private function __clone()
35     {
36     }
37
38     /**
39      * prevent instance from being unserialized
40      */
41     private function __wakeup()
42     {
43     }
44 }

```

Test

1.1.5 Pool

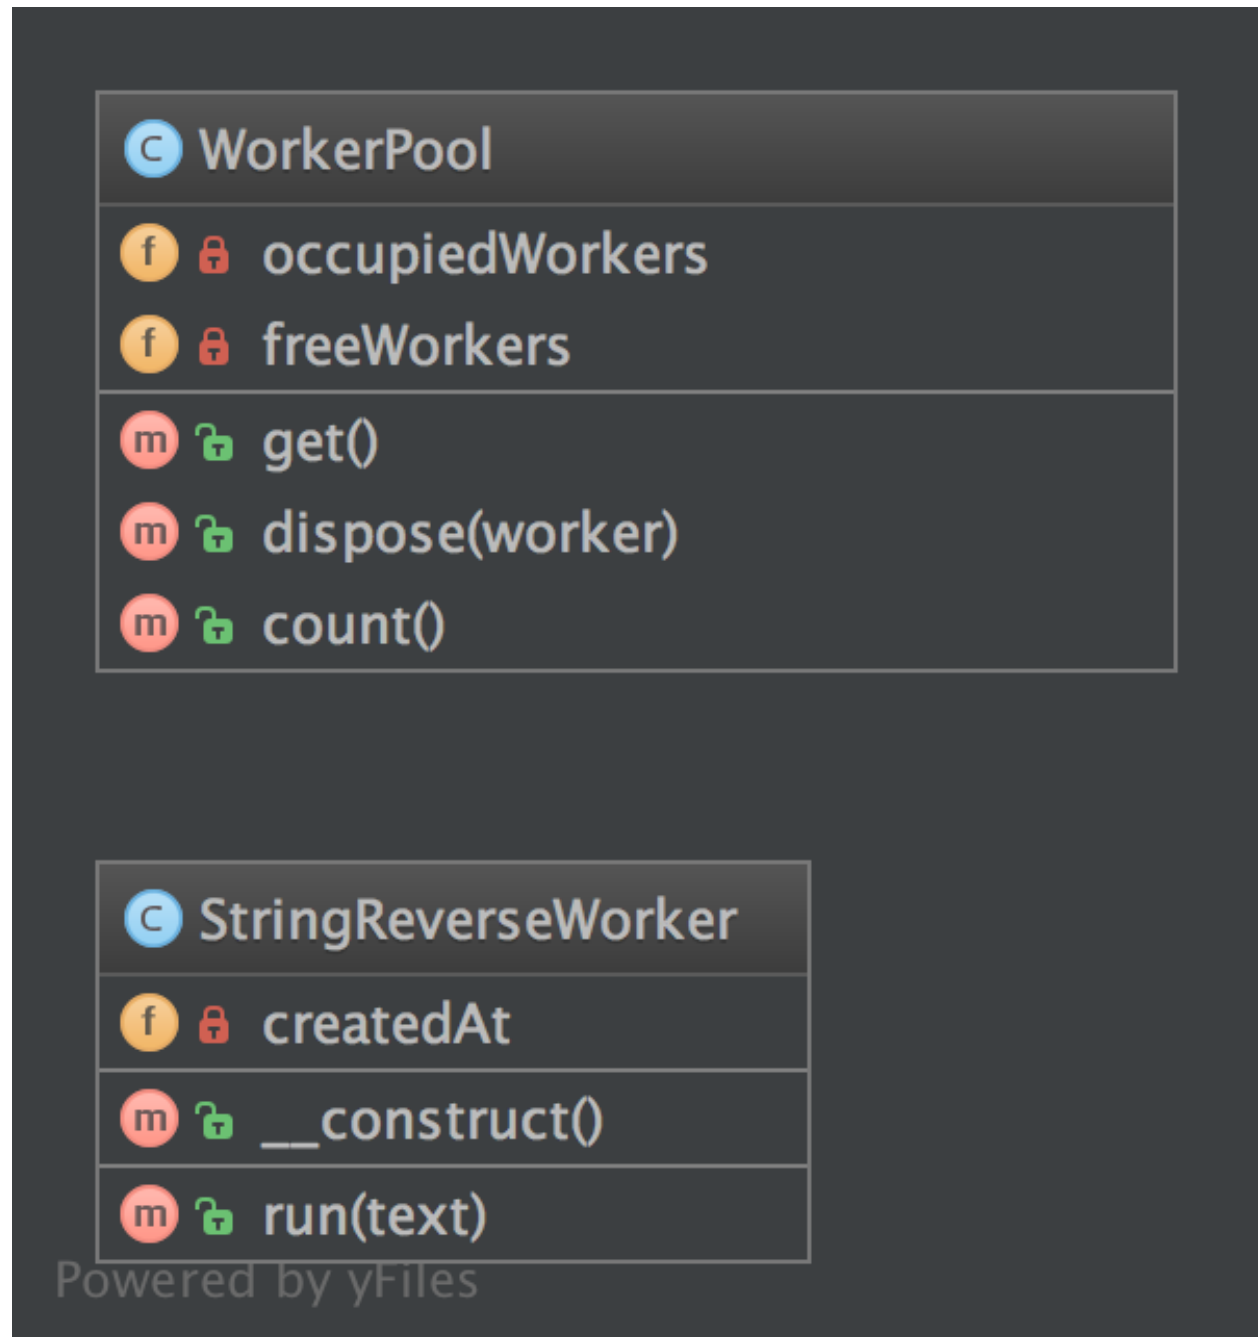

Purpose

The **object pool pattern** is a software creational design pattern that uses a set of initialized objects kept ready to use – a “pool” – rather than allocating and destroying them on demand. A client of the pool will request an object from the pool and perform operations on the returned object. When the client has finished, it returns the object, which is a specific type of factory object, to the pool rather than destroying it.

Object pooling can offer a significant performance boost in situations where the cost of initializing a class instance is high, the rate of instantiation of a class is high, and the number of instances in use at any one time is low. The pooled object is obtained in predictable time when creation of the new objects (especially over network) may take variable time.

However these benefits are mostly true for objects that are expensive with respect to time, such as database connections, socket connections, threads and large graphic objects like fonts or bitmaps. In certain situations, simple object pooling (that hold no external resources, but only occupy memory) may not be efficient and could decrease performance.

27         $this->assertSame($worker1, $worker2);
28     }
29 }
```

1.1.6 Prototype

Purpose

To avoid the cost of creating objects the standard way (`new Foo()`) and instead create a prototype and clone it.

Examples

- Large amounts of data (e.g. create 1,000,000 rows in a database at once via a ORM).

UML Diagram

Code

You can also find these code on [GitHub](#)

BookPrototype.php

```

1  <?php
2
3  namespace DesignPatterns\Creational\Prototype;
4
5  abstract class BookPrototype

8       * @var string
9       */
10     protected $title;
11
12     /**
13      * @var string
14      */
15     protected $category;
16
17     abstract public function __clone();
  
```

```
18
19     public function getTitle(): string
20     {
21         return $this->title;
22     }
23
24     public function setTitle($title)
25     {
26         $this->title = $title;
27     }
28 }
```

BarBookPrototype.php

```
1 <?php
2
3 namespace DesignPatterns\Creational\Prototype;
4
5 class BarBookPrototype extends BookPrototype
6 {
7     /**
8      * @var string
9      */
10    protected $category = 'Bar';
11
12    public function __clone()
13    {
14    }
15 }
```

FooBookPrototype.php

```
1 <?php
2
3 namespace DesignPatterns\Creational\Prototype;
4
5 class FooBookPrototype extends BookPrototype
6 {
7     /**
8      * @var string
9      */
10    protected $category = 'Foo';
11
12    public function __clone()
13    {
14    }
15 }
```

Test

Tests/PrototypeTest.php

```
1 <?php
2
3 namespace DesignPatterns\Creational\Prototype\Tests;
4
5 use DesignPatterns\Creational\Prototype\BarBookPrototype;
6 use DesignPatterns\Creational\Prototype\FooBookPrototype;
```

```
7
8 class PrototypeTest extends \PHPUnit_Framework_TestCase
9 {
10     public function testCanGetFooBook()
11     {
12         $fooPrototype = new FooBookPrototype();
13         $barPrototype = new BarBookPrototype();
14
15         for ($i = 0; $i < 10; $i++) {
16             $book = clone $fooPrototype;
17             $book->setTitle('Foo Book No ' . $i);
18             $this->assertInstanceOf('DesignPatterns\Creational\Prototype\FooBookPrototype', $book);
19         }
20
21         for ($i = 0; $i < 5; $i++) {
22             $book = clone $barPrototype;
23             $book->setTitle('Bar Book No ' . $i);
24             $this->assertInstanceOf('DesignPatterns\Creational\Prototype\BarBookPrototype', $book);
25         }
26     }
27 }
```

1.1.7 Simple Factory

Purpose

SimpleFactory is a simple factory pattern.

It differs from the static factory because it is not static. Therefore, you can have multiple factories, differently parametrized, you can subclass it and you can mock it. It always should be preferred over a static factory!

UML Diagram

Code

You can also find these code on [GitHub](#)

SimpleFactory.php

```
1 <?php
2
3 namespace DesignPatterns\Creational\SimpleFactory;
4
5 class SimpleFactory
6 {
7     public function createBicycle(): Bicycle
8     {
9         return new Bicycle();
10    }
11 }
```

VehicleInterface.php

Bicycle.php

```

1 <?php
2
3 namespace DesignPatterns\Creational\SimpleFactory;
4
5 class Bicycle
6 {
7     public function driveTo(string $destination)
8     {
9     }
10 }

```

Usage

```

1 $factory = new SimpleFactory();
2 $bicycle = $factory->createBicycle();
3 $bicycle->driveTo('Paris');

```

Test

Tests/SimpleFactoryTest.php

```

1 <?php
2
3 namespace DesignPatterns\Creational\SimpleFactory\Tests;
4
5 use DesignPatterns\Creational\SimpleFactory\SimpleFactory;
6
7 class SimpleFactoryTest extends \PHPUnit_Framework_TestCase
8 {
9     public function testCanCreateBicycle()
10    {
11        $bicycle = (new SimpleFactory())->createBicycle();
12        $this->assertInstanceOf('DesignPatterns\Creational\SimpleFactory\Bicycle', $bicycle);
13    }
14 }

```

1.1.8 Singleton

THIS IS CONSIDERED TO BE AN ANTI-PATTERN! FOR BETTER TESTABILITY AND MAINTAINABILITY USE DEPENDENCY INJECTION!

Purpose

To have only one instance of this object in the application that will handle all calls.

Examples

- DB Connector
- Logger (may also be a Multiton if there are many log files for several purposes)
- Lock file for the application (there is only one in the filesystem ...)

UML Diagram

Code

You can also find these code on [GitHub](#)

Singleton.php

```
1 <?php
2
3 namespace DesignPatterns\Creational\Singleton;
4
5 final class Singleton
6 {
7     /**
8      * @var Singleton
9      */
10    private static $instance;
11
12    /**
13     * gets the instance via lazy initialization (created on first usage)
14     */
15    public static function getInstance(): Singleton
16    {
17        if (null === static::$instance) {
18            static::$instance = new static();
19        }
20
21        return static::$instance;
22    }
23
24    /**
25     * is not allowed to call from outside to prevent from creating multiple instances,
26     * to use the singleton, you have to obtain the instance from Singleton::getInstance() instead
27     */
28    private function __construct()
29    {
30    }
31
32    /**
33     * prevent the instance from being cloned (which would create a second instance of it)
```

```

34     */
35     private function __clone()
36     {
37     }
38
39     /**
40      * prevent from being unserialized (which would create a second instance of it)
41      */
42     private function __wakeup()
43     {
44     }
45 }

```

Test

Tests/SingletonTest.php

```

1  <?php
2
3  namespace DesignPatterns\Creational\Singleton\Tests;
4
5  use DesignPatterns\Creational\Singleton\Singleton;
6
7  class SingletonTest extends \PHPUnit_Framework_TestCase
8  {
9      public function testUniqueness()
10     {
11         $firstCall = Singleton::getInstance();
12         $secondCall = Singleton::getInstance();
13
14         $this->assertInstanceOf('DesignPatterns\Creational\Singleton\Singleton', $firstCall);
15         $this->assertSame($firstCall, $secondCall);
16     }
17 }

```

1.1.9 Static Factory

Purpose

Similar to the AbstractFactory, this pattern is used to create series of related or dependent objects. The difference between this and the abstract factory pattern is that the static factory pattern uses just one static method to create all types of objects it can create. It is usually named `factory` or `build`.

Examples

- Zend Framework: `Zend_Cache_Backend` or `_Frontend` use a factory method create cache backends or frontends

UML Diagram

Code

12             'DesignPatterns\Creational\StaticFactory\FormatNumber',
13             StaticFactory::factory('number')
14         );
15     }
16
17     public function testCanCreateStringFormatter()
18     {
19         $this->assertInstanceOf(
20             'DesignPatterns\Creational\StaticFactory\FormatString',
21             StaticFactory::factory('string')

```

```
22         );  
23     }  
24  
25     /**  
26      * @expectedException \InvalidArgumentException  
27      */  
28     public function testException()  
29     {  
30         StaticFactory::factory('object');  
31     }  
32 }
```

1.2 Structural

In Software Engineering, Structural Design Patterns are Design Patterns that ease the design by identifying a simple way to realize relationships between entities.

1.2.1 Adapter / Wrapper

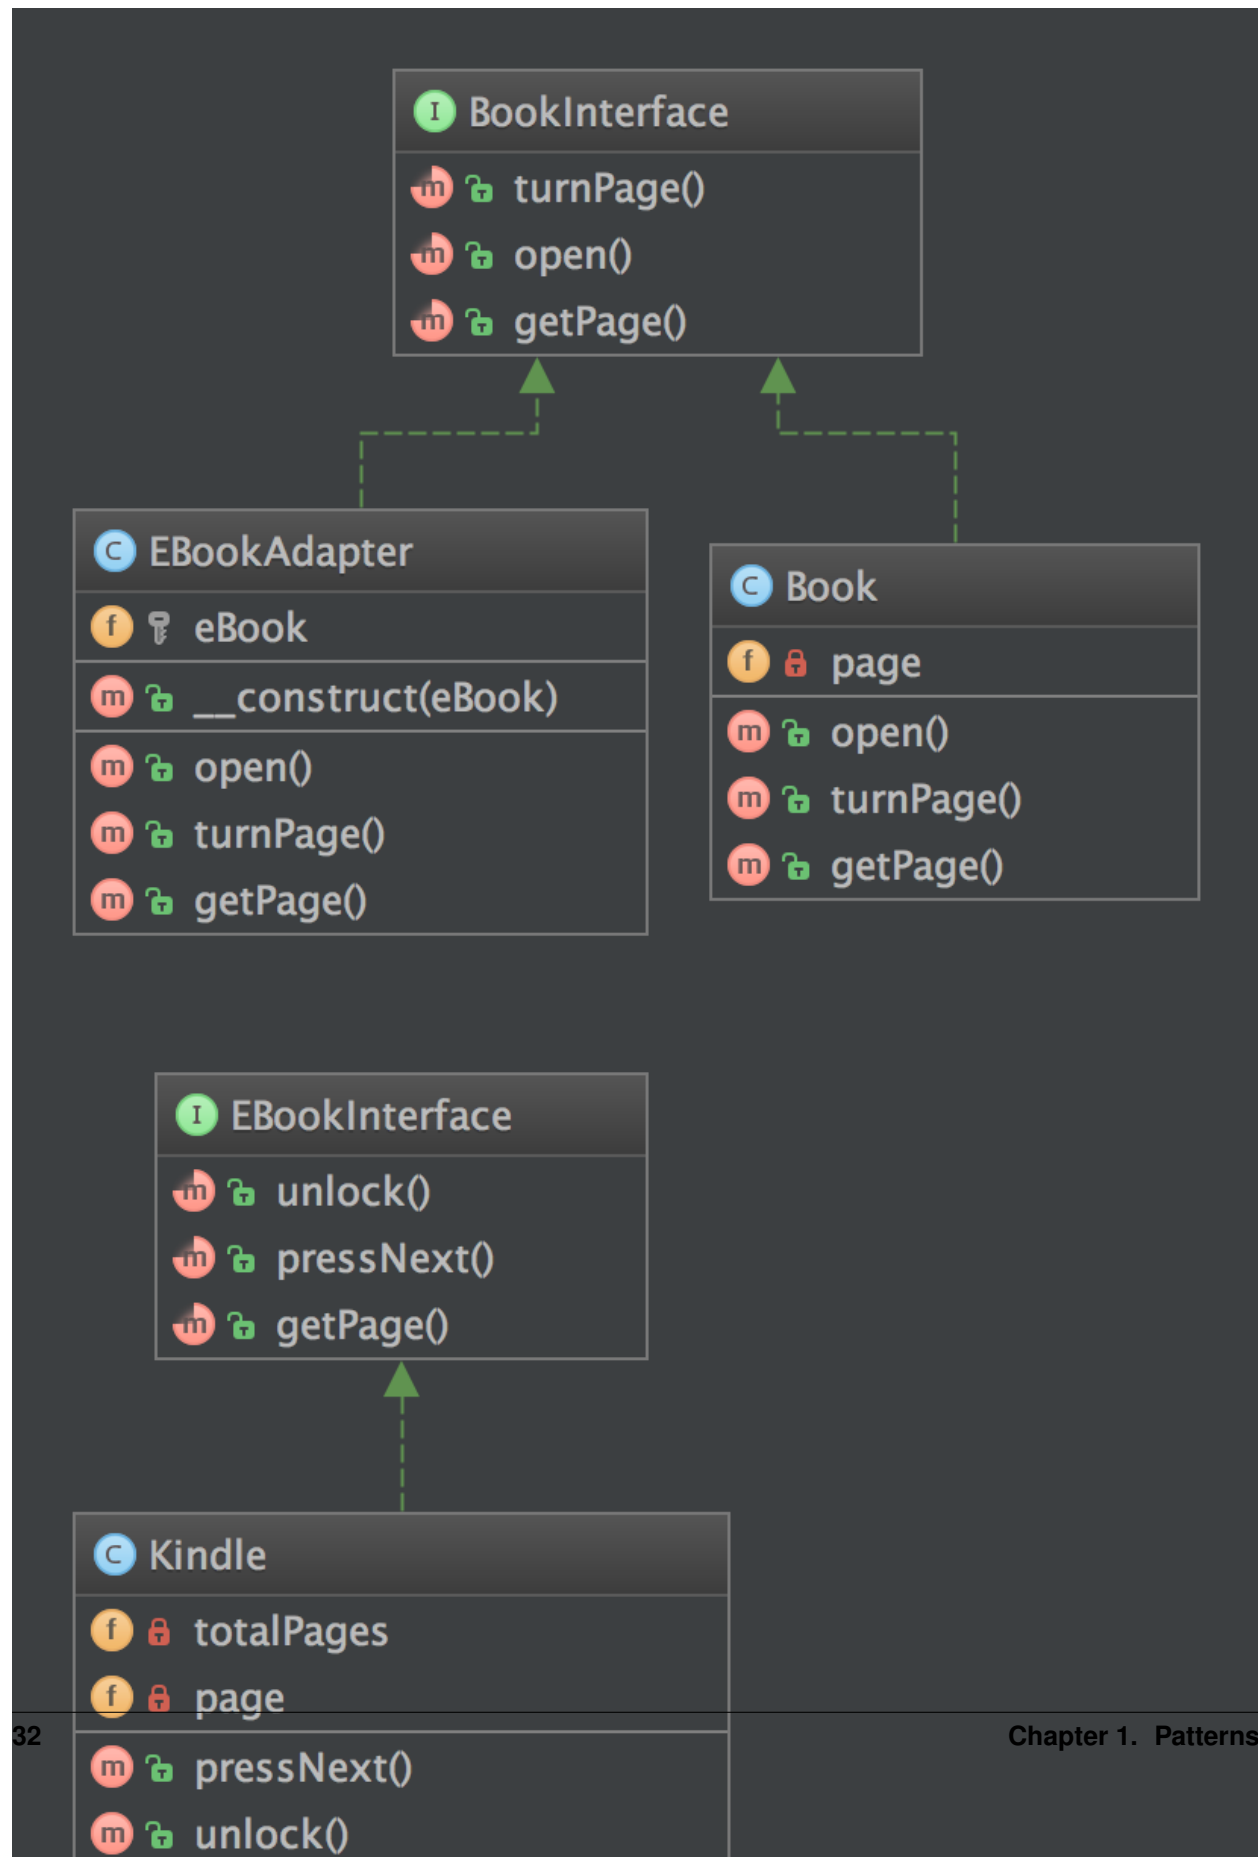

Purpose

To translate one interface for a class into a compatible interface. An adapter allows classes to work together that normally could not because of incompatible interfaces by providing its interface to clients while using the original interface.

Examples

- DB Client libraries adapter
- using multiple different webservises and adapters normalize data so that the outcome is the same for all

UML Diagram

Code

14         $book->open();
15         $book->turnPage();
16
17         $this->assertEquals(2, $book->getPage());
18     }
19
20     public function testCanTurnPageOnKindleLikeInANormalBook()
21     {
22         $kindle = new Kindle();
23         $book = new EBookAdapter($kindle);
24
25         $book->open();

```

```

26     $book->turnPage();
27
28     $this->assertEquals(2, $book->getPage());
29 }
30 }

```

1.2.2 Bridge

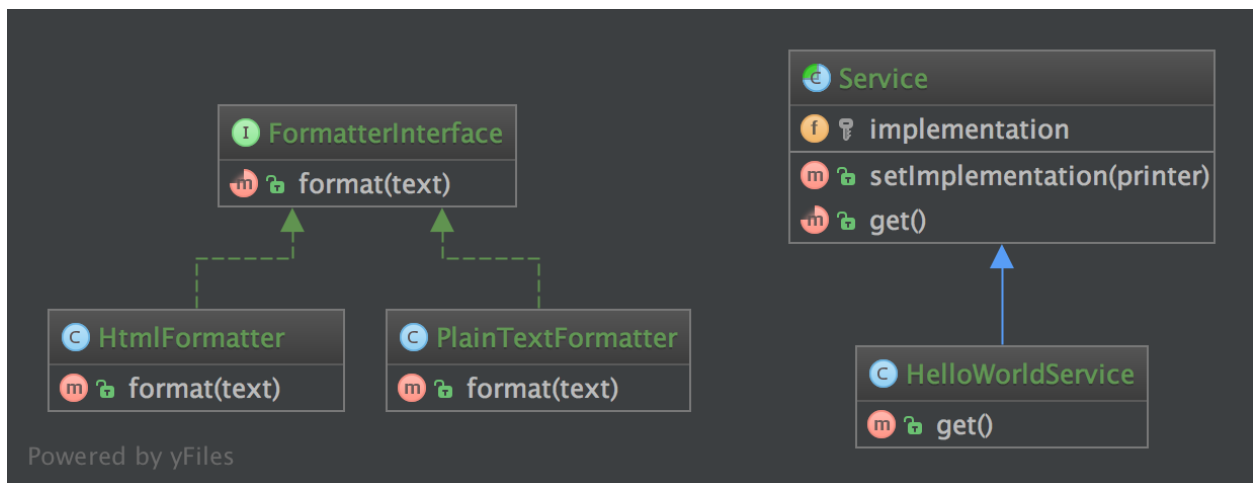

Purpose

Decouple an abstraction from its implementation so that the two can vary independently.

Examples

- [Symfony DoctrineBridge](#)

UML Diagram

Code

You can also find these code on [GitHub](#)

FormatterInterface.php

```

1  <?php
2
3  namespace DesignPatterns\Structural\Bridge;
4
5  interface FormatterInterface
6  {
7      public function format(string $text);
8  }

```

PlainTextFormatter.php

```

1 <?php
2
3 namespace DesignPatterns\Structural\Bridge;
4
5 class PlainTextFormatter implements FormatterInterface
6 {
7     public function format(string $text)
8     {
9         return $text;
10    }
11 }

```

HtmlFormatter.php

```

1 <?php
2
3 namespace DesignPatterns\Structural\Bridge;
4
5 class HtmlFormatter implements FormatterInterface
6 {
7     public function format(string $text)
8     {
9         return sprintf('<p>%s</p>', $text);
10    }
11 }

```

Service.php

```

1 <?php
2
3 namespace DesignPatterns\Structural\Bridge;
4
5 abstract class Service
6 {
7     /**
8      * @var FormatterInterface
9      */
10    protected $implementation;
11
12    /**
13     * @param FormatterInterface $printer
14     */
15    public function __construct(FormatterInterface $printer)
16    {
17        $this->implementation = $printer;
18    }
19
20    /**
21     * @param FormatterInterface $printer
22     */
23    public function setImplementation(FormatterInterface $printer)
24    {
25        $this->implementation = $printer;
26    }
27
28    abstract public function get();
29 }

```

HelloWorldService.php

```
1 <?php
2
3 namespace DesignPatterns\Structural\Bridge;
4
5 class HelloWorldService extends Service
6 {
7     public function get()
8     {
9         return $this->implementation->format('Hello World');
10    }
11 }
```

Test

Tests/BridgeTest.php

```
1 <?php
2
3 namespace DesignPatterns\Structural\Bridge\Tests;
4
5 use DesignPatterns\Structural\Bridge\HelloWorldService;
6 use DesignPatterns\Structural\Bridge\HtmlFormatter;
7 use DesignPatterns\Structural\Bridge\PlainTextFormatter;
8
9 class BridgeTest extends \PHPUnit_Framework_TestCase
10 {
11     public function testCanPrintUsingThePlainTextPrinter()
12     {
13         $service = new HelloWorldService(new PlainTextFormatter());
14         $this->assertEquals('Hello World', $service->get());
15
16         // now change the implemenation and use the HtmlFormatter instead
17         $service->setImplementation(new HtmlFormatter());
18         $this->assertEquals('<p>Hello World</p>', $service->get());
19     }
20 }
```

1.2.3 Composite

Purpose

To treat a group of objects the same way as a single instance of the object.

Examples

- a form class instance handles all its form elements like a single instance of the form, when `render()` is called, it subsequently runs through all its child elements and calls `render()` on them
- `Zend_Config`: a tree of configuration options, each one is a `Zend_Config` object itself

22         );
23     }
24 }

```

1.2.4 Data Mapper

Purpose

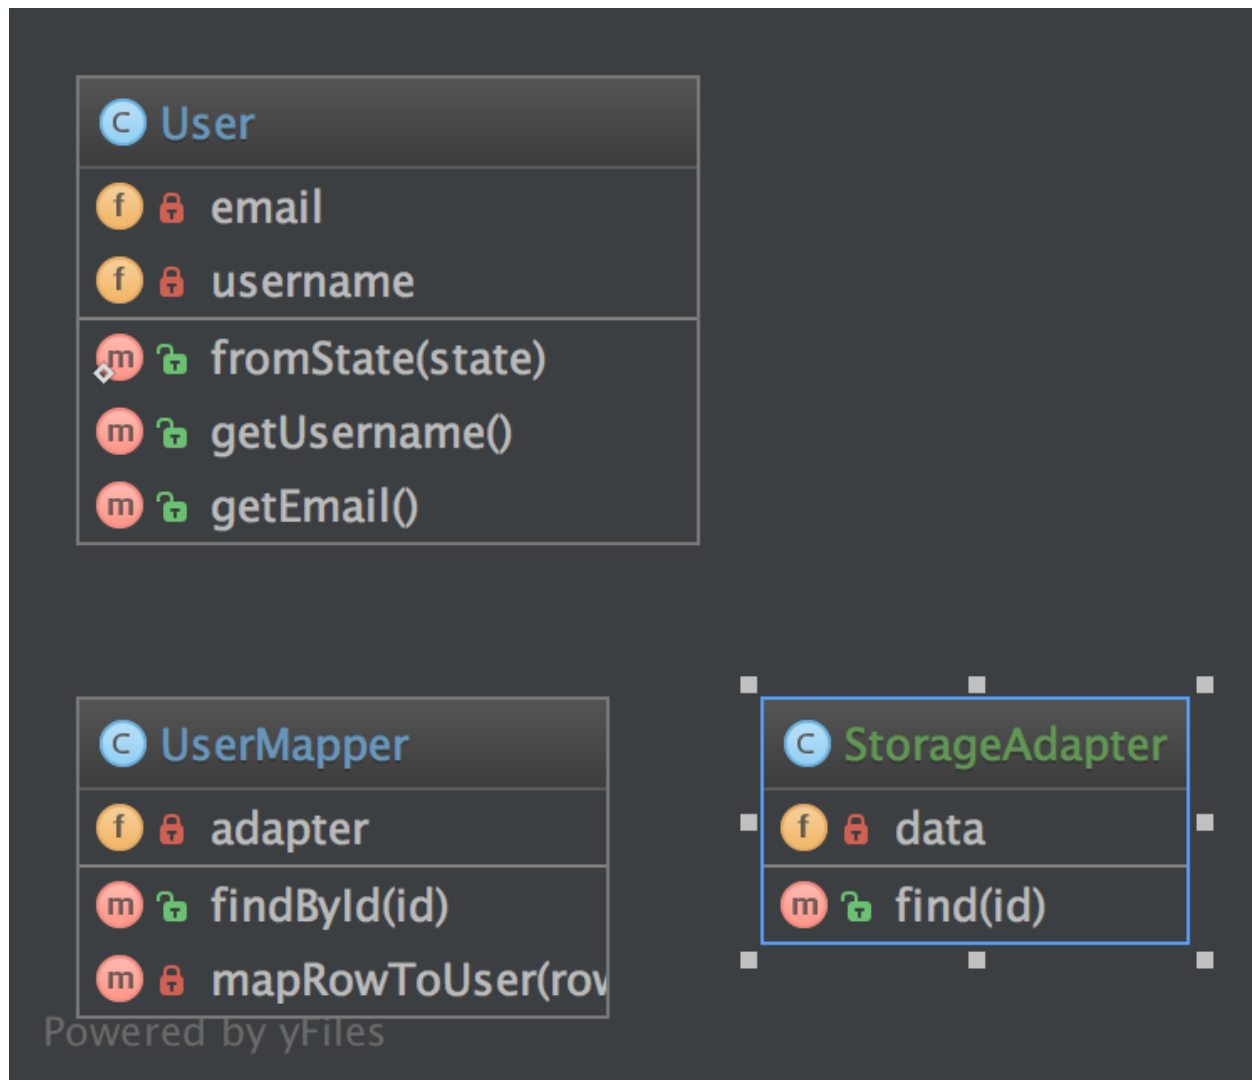

A Data Mapper, is a Data Access Layer that performs bidirectional transfer of data between a persistent data store (often a relational database) and an in memory data representation (the domain layer). The goal of the pattern is to keep the in memory representation and the persistent data store independent of each other and the data mapper itself. The layer is composed of one or more mappers (or Data Access Objects), performing the data transfer. Mapper implementations vary in scope. Generic mappers will handle many different domain entity types, dedicated mappers will handle one or a few.

The key point of this pattern is, unlike Active Record pattern, the data model follows Single Responsibility Principle.

Examples

- DB Object Relational Mapper (ORM) : Doctrine2 uses DAO named as “EntityRepository”

28         $mapper->findById(1);
29     }
30 }

```

1.2.5 Decorator

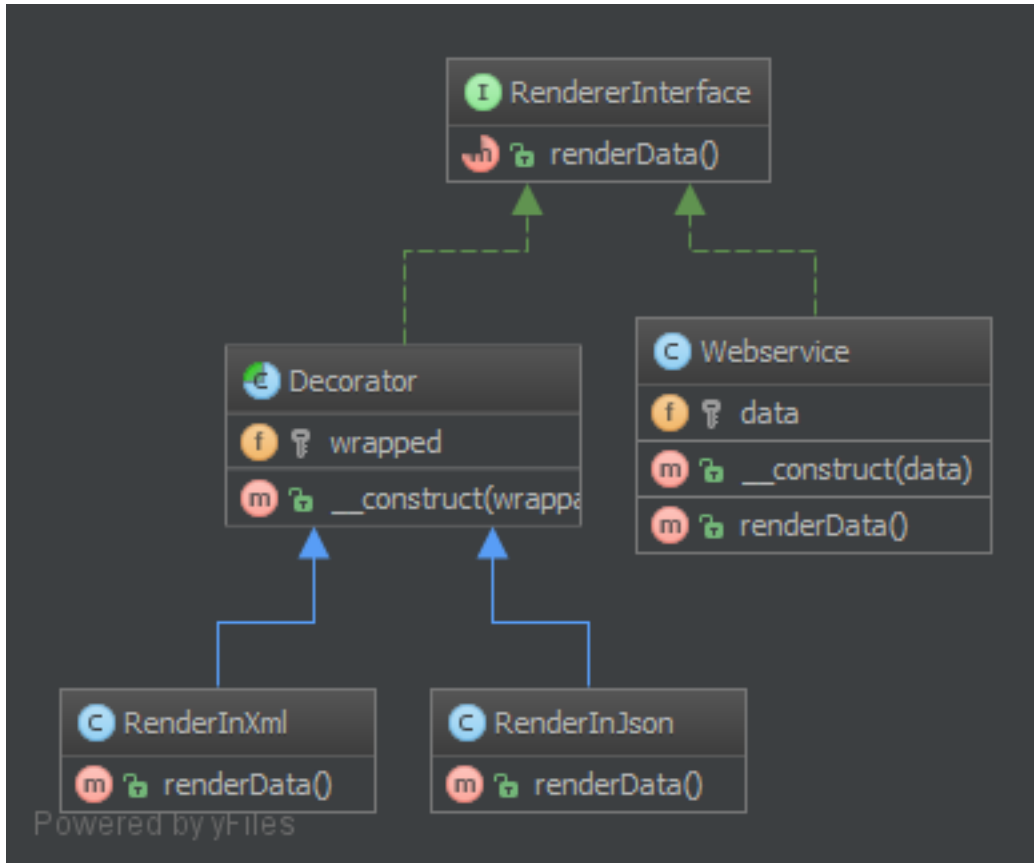

Purpose

To dynamically add new functionality to class instances.

Examples

- Zend Framework: decorators for `Zend_Form_Element` instances
- Web Service Layer: Decorators JSON and XML for a REST service (in this case, only one of these should be allowed of course)

UML Diagram

13
14     protected function setUp()
15     {
16         $this->service = new Decorator\WebService('foobar');
17     }
18
19     public function testJsonDecorator()
20     {
21         $service = new Decorator\JsonRenderer($this->service);
22
23         $this->assertEquals('"foobar"', $service->renderData());
24     }
25
26     public function testXmlDecorator()
27     {
28         $service = new Decorator\XmlRenderer($this->service);
29
30         $this->assertXmlStringEqualsXmlString('<?xml version="1.0"?><content>foobar</content>', $service->renderData());
31     }
32 }
```

1.2.6 Dependency Injection

Purpose

To implement a loosely coupled architecture in order to get better testable, maintainable and extendable code.

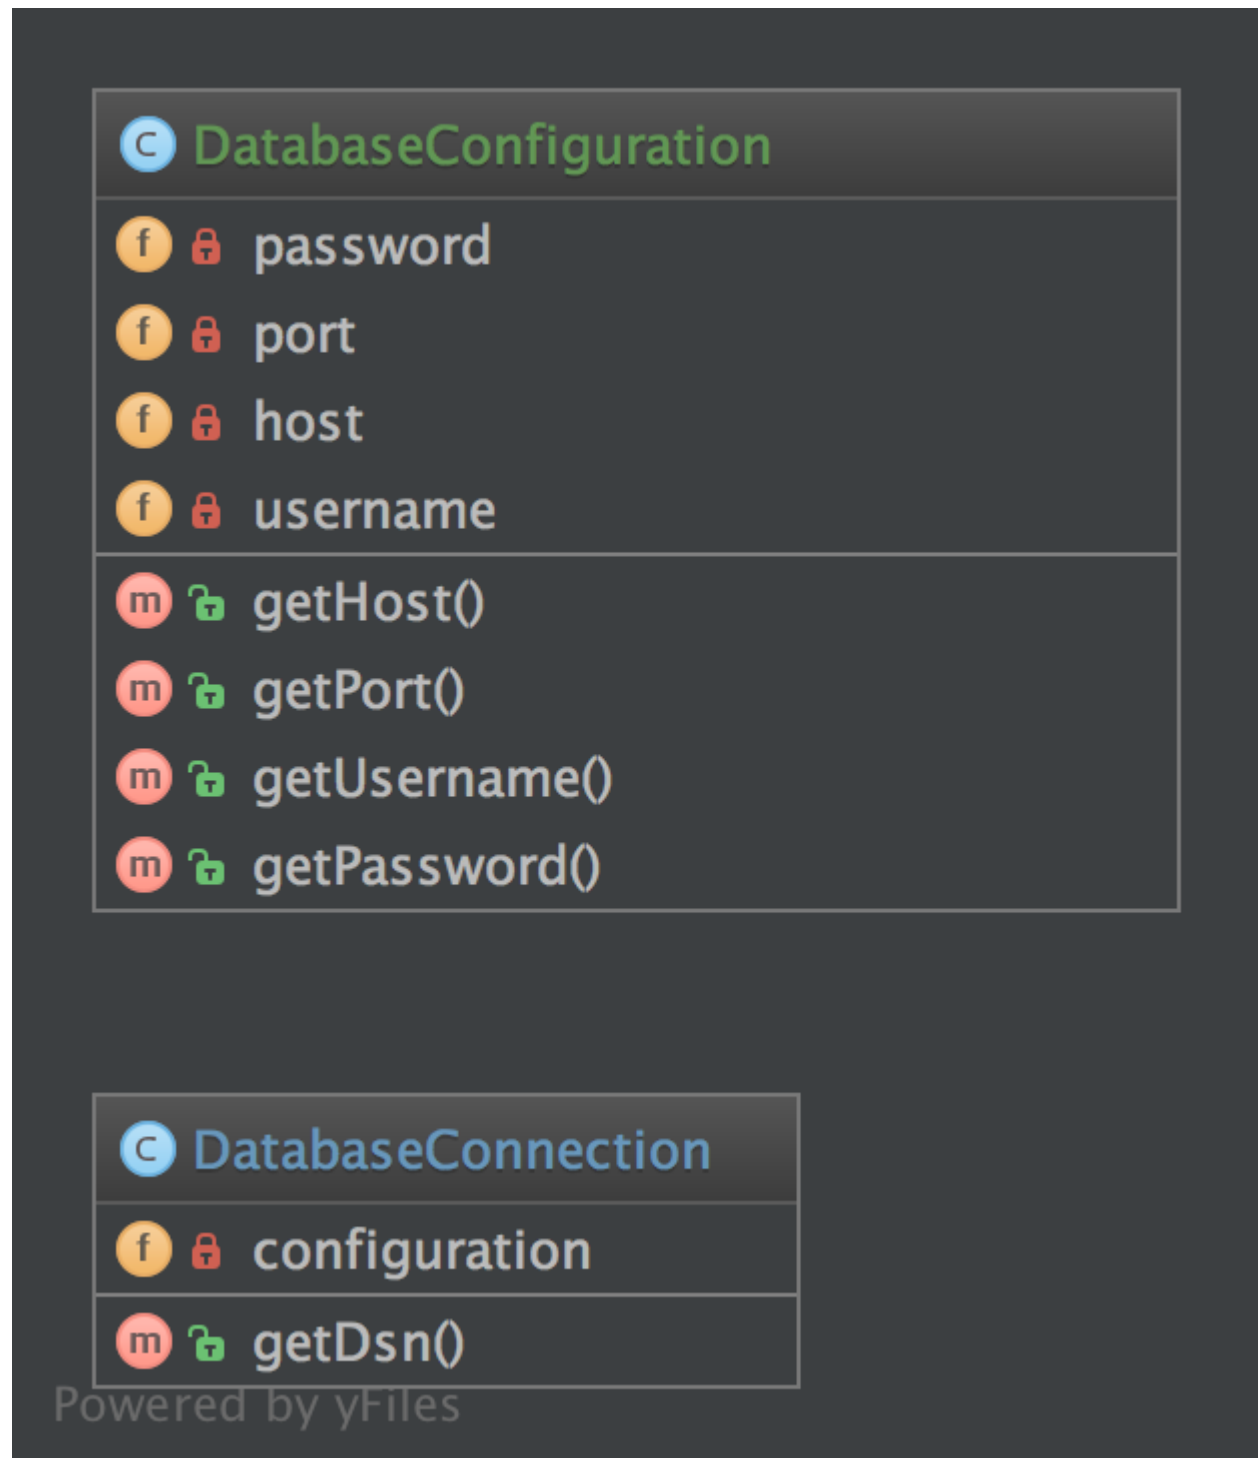

Usage

`DatabaseConfiguration` gets injected and `DatabaseConnection` will get all that it needs from `$config`. Without DI, the configuration would be created directly in `DatabaseConnection`, which is not very good for testing and extending it.

Examples

- The Doctrine2 ORM uses dependency injection e.g. for configuration that is injected into a `Connection` object. For testing purposes, one can easily create a mock object of the configuration and inject that into the `Connection` object
- Symfony and Zend Framework 2 already have containers for DI that create objects via a configuration array and inject them where needed (i.e. in Controllers)

11    {
12        $config = new DatabaseConfiguration('localhost', 3306, 'domnikl', '1234');
13        $connection = new DatabaseConnection($config);
14
15        $this->assertEquals('domnikl:1234@localhost:3306', $connection->getDsn());
16    }
17 }
```

1.2.7 Facade

Purpose

The primary goal of a Facade Pattern is not to avoid you to read the manual of a complex API. It's only a side-effect. The first goal is to reduce coupling and follow the Law of Demeter.

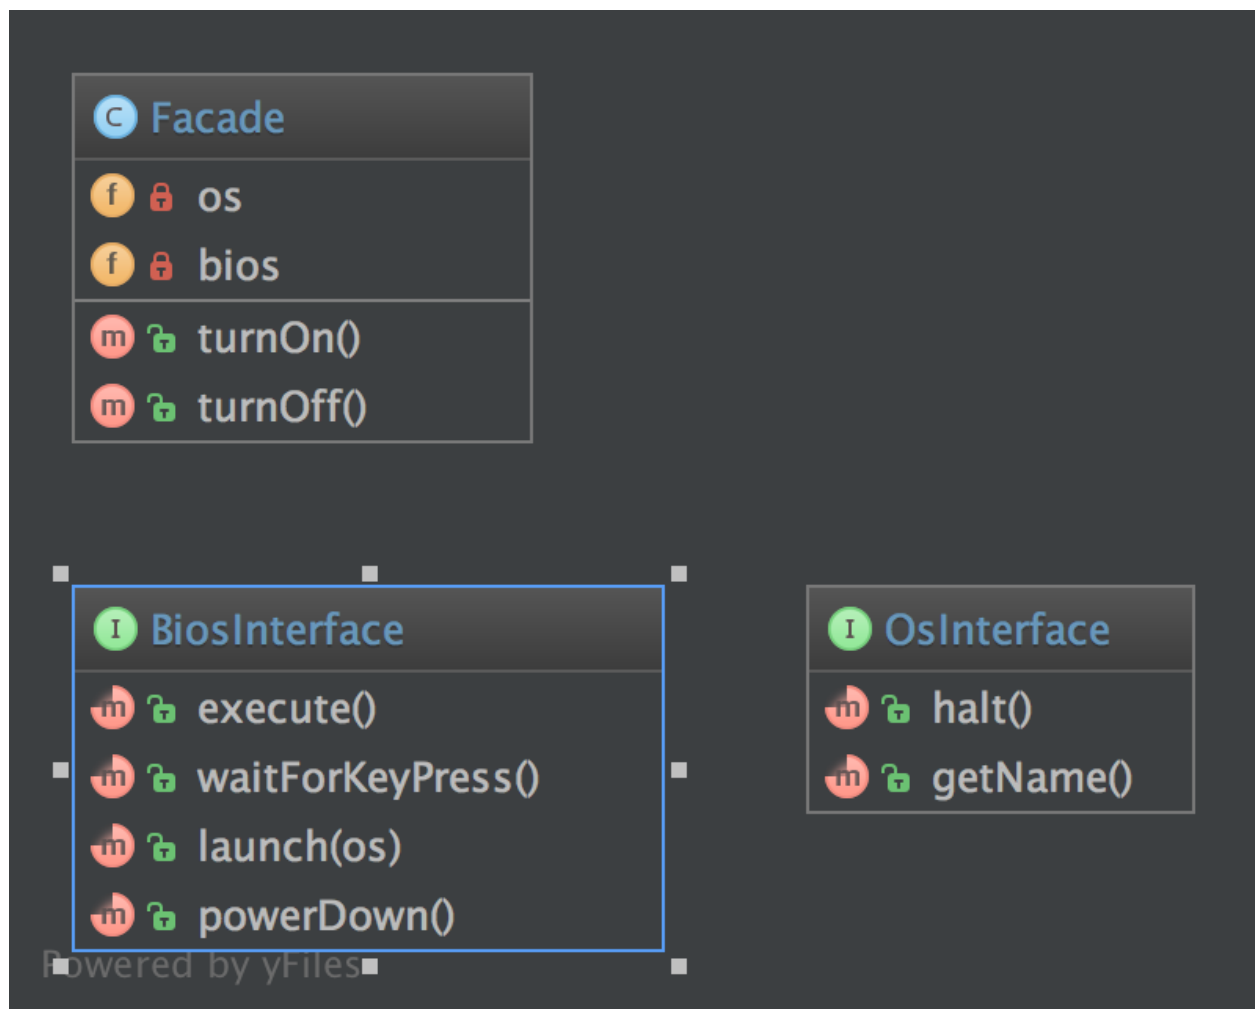

A Facade is meant to decouple a client and a sub-system by embedding many (but sometimes just one) interface, and of course to reduce complexity.

- A facade does not forbid you the access to the sub-system
- You can (you should) have multiple facades for one sub-system

That's why a good facade has no `new` in it. If there are multiple creations for each method, it is not a Facade, it's a Builder or a [Abstract|Static|Simple] Factory [Method].

The best facade has no `new` and a constructor with interface-type-hinted parameters. If you need creation of new instances, use a Factory as argument.

8      * @var OsInterface
9      */
10    private $os;
11
12    /**
13     * @var BiosInterface
14     */
15    private $bios;
16
17    /**
18     * @param BiosInterface $bios
19     * @param OsInterface $os
20     */
21    public function __construct(BiosInterface $bios, OsInterface $os)
22    {
23        $this->bios = $bios;
24        $this->os = $os;
25    }
26
27    public function turnOn()
28    {
29        $this->bios->execute();
30        $this->bios->waitForKeyPress();
31        $this->bios->launch($this->os);
32    }
33
34    public function turnOff()
35    {
36        $this->os->halt();
37        $this->bios->powerDown();
38    }
39 }
```

OsInterface.php

```
1 <?php
2
3 namespace DesignPatterns\Structural\Facade;
4
5 interface OsInterface
6 {
7     public function halt();
8
9     public function getName(): string;
10 }
```

BiosInterface.php

```

1 <?php
2
3 namespace DesignPatterns\Structural\Facade;
4
5 interface BiosInterface
6 {
7     public function execute();
8
9     public function waitForKeyPress();
10
11     public function launch(OsInterface $os);
12
13     public function powerDown();
14 }

```

Test

Tests/FacadeTest.php

```

1 <?php
2
3 namespace DesignPatterns\Structural\Facade\Tests;
4
5 use DesignPatterns\Structural\Facade\Facade;
6 use DesignPatterns\Structural\Facade\OsInterface;
7
8 class FacadeTest extends \PHPUnit_Framework_TestCase
9 {
10     public function testComputerOn()
11     {
12         /** @var OsInterface|\PHPUnit_Framework_MockObject_MockObject $os */
13         $os = $this->createMock('DesignPatterns\Structural\Facade\OsInterface');
14
15         $os->method('getName')
16             ->will($this->returnValue('Linux'));
17
18         $bios = $this->getMockBuilder('DesignPatterns\Structural\Facade\BiosInterface')
19             ->setMethods(['launch', 'execute', 'waitForKeyPress'])
20             ->disableAutoload()
21             ->getMock();
22
23         $bios->expects($this->once())
24             ->method('launch')
25             ->with($os);
26
27         $facade = new Facade($bios, $os);
28
29         // the facade interface is simple
30         $facade->turnOn();
31
32         // but you can also access the underlying components
33         $this->assertEquals('Linux', $os->getName());
34     }
35 }

```

1.2.8 Fluent Interface

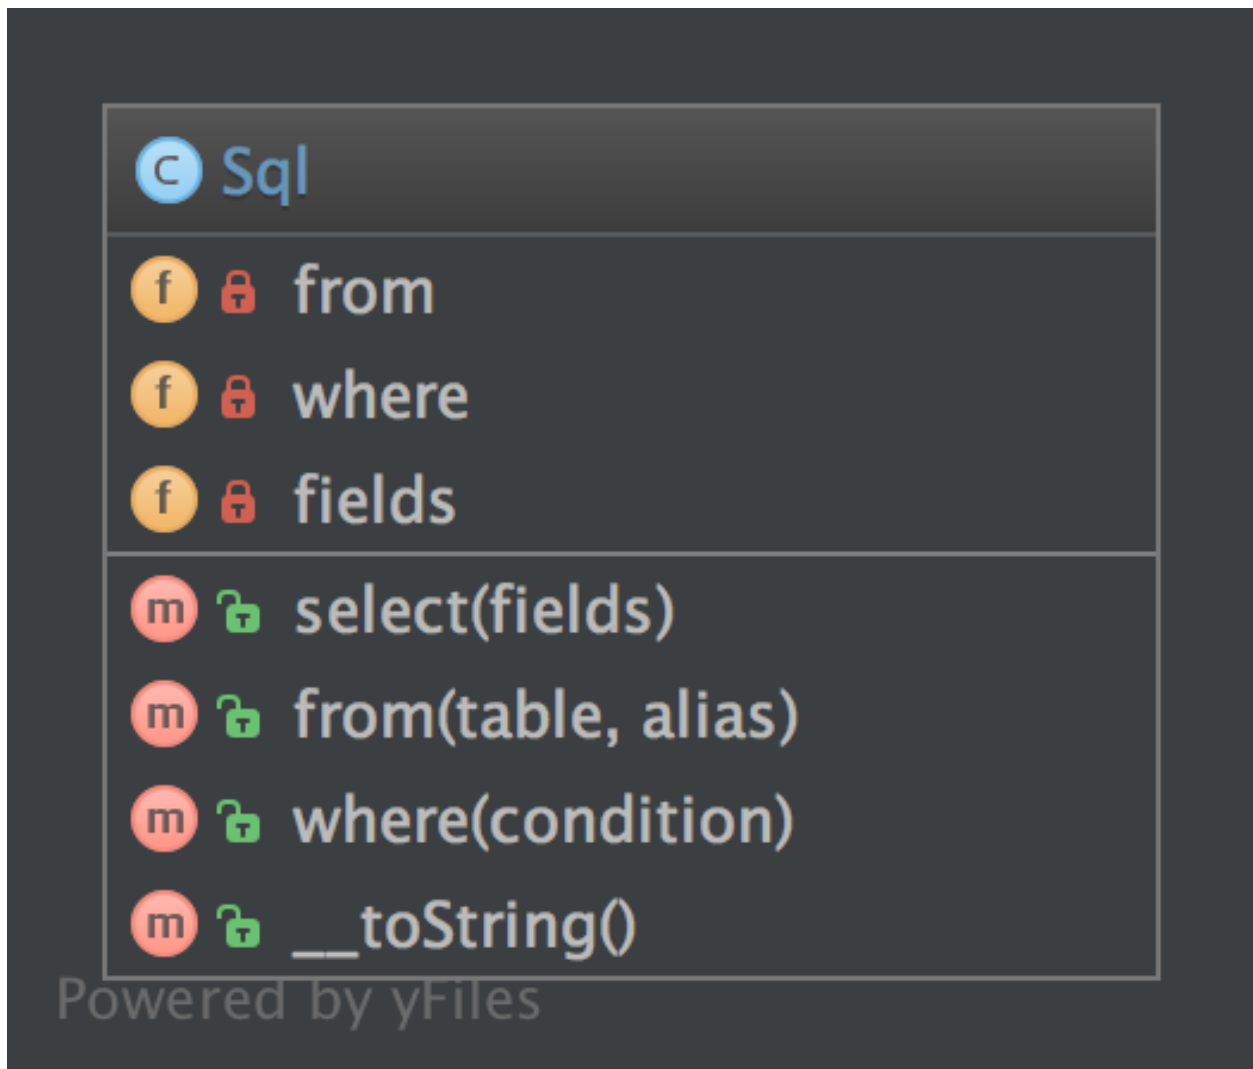

Purpose

To write code that is easy readable just like sentences in a natural language (like English).

Examples

- Doctrine2's QueryBuilder works something like that example class below
- PHPUnit uses fluent interfaces to build mock objects
- Yii Framework: CDbCommand and CActiveRecord use this pattern, too

UML Diagram

Code

15
16         $this->assertEquals('SELECT foo, bar FROM foobar AS f WHERE f.bar = ?', (string) $query);
17     }
18 }
```

1.2.9 Flyweight

Purpose

To minimise memory usage, a Flyweight shares as much as possible memory with similar objects. It is needed when a large amount of objects is used that don't differ much in state. A common practice is to hold state in external data structures and pass them to the flyweight object when needed.

17         foreach ($this->characters as $char) {
18             foreach ($this->fonts as $font) {
19                 $flyweight = $factory->get($char);
20                 $rendered = $flyweight->render($font);
21
22                 $this->assertEquals(sprintf('Character %s with font %s', $char, $font), $rendered);
23             }
24         }
25
26         // Flyweight pattern ensures that instances are shared
27         // instead of having hundreds of thousands of individual objects
28         // there must be one instance for every char that has been reused for displaying in different
29         $this->assertCount(count($this->characters), $factory);
30     }
31 }

```

1.2.10 Proxy

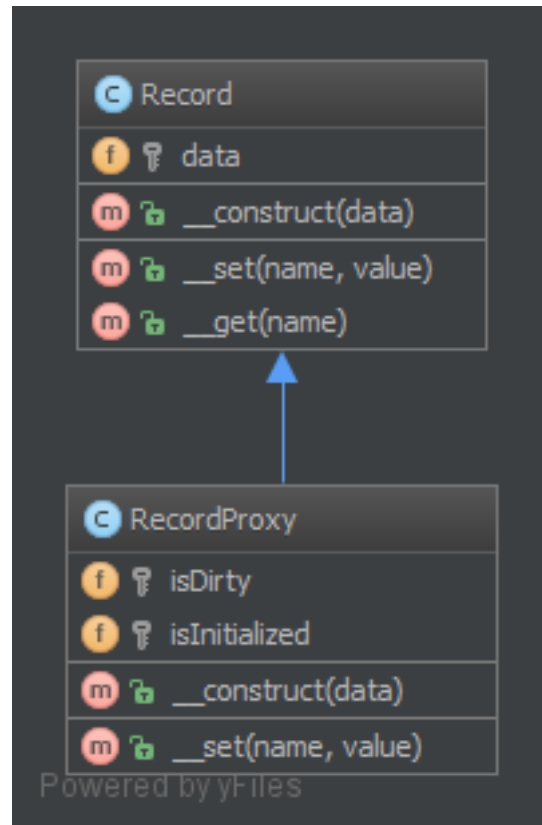

Purpose

To interface to anything that is expensive or impossible to duplicate.

Examples

- Doctrine2 uses proxies to implement framework magic (e.g. lazy initialization) in them, while the user still works with his own entity classes and will never use nor touch the proxies

48  }
49  }
```

Test

1.2.11 Registry

Purpose

To implement a central storage for objects often used throughout the application, is typically implemented using an abstract class with only static methods (or using the Singleton pattern). Remember that this introduces global state, which should be avoided at all times! Instead implement it using Dependency Injection!

Examples

- Zend Framework 1: Zend_Registry holds the application's logger object, front controller etc.
- Yii Framework: CWebApplication holds all the application components, such as CWebUser, CUrlManager, etc.

UML Diagram

Code

You can also find these code on [GitHub](#)

Registry.php

```

40     }
41 }
```

1.3 Behavioral

In software engineering, behavioral design patterns are design patterns that identify common communication patterns between objects and realize these patterns. By doing so, these patterns increase flexibility in carrying out this communication.

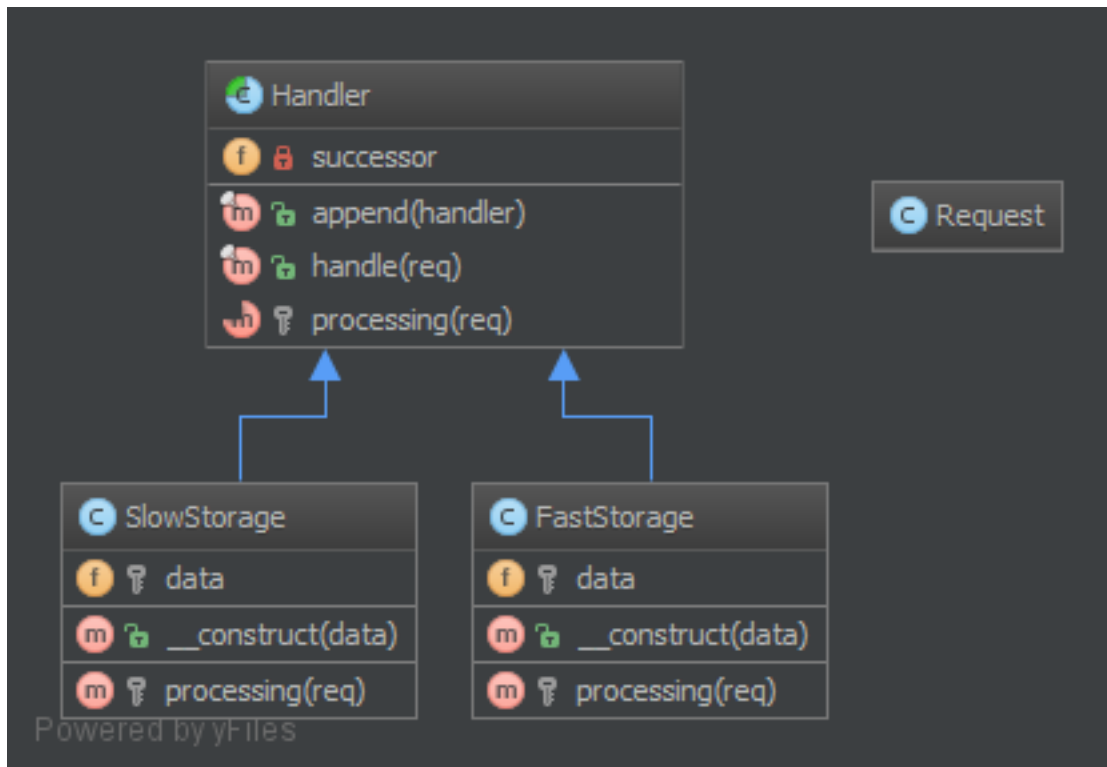

1.3.1 Chain Of Responsibilities

Purpose:

To build a chain of objects to handle a call in sequential order. If one object cannot handle a call, it delegates the call to the next in the chain and so forth.

Examples:

- logging framework, where each chain element decides autonomously what to do with a log message
- a Spam filter
- Caching: first object is an instance of e.g. a Memcached Interface, if that “misses” it delegates the call to the database interface
- Yii Framework: CFilterChain is a chain of controller action filters. the executing point is passed from one filter to the next along the chain, and only if all filters say “yes”, the action can be invoked at last.

50 }
51 }

```

1.3.2 Command

Purpose

To encapsulate invocation and decoupling.

We have an Invoker and a Receiver. This pattern uses a “Command” to delegate the method call against the Receiver and presents the same method “execute”. Therefore, the Invoker just knows to call “execute” to process the Command of the client. The Receiver is decoupled from the Invoker.

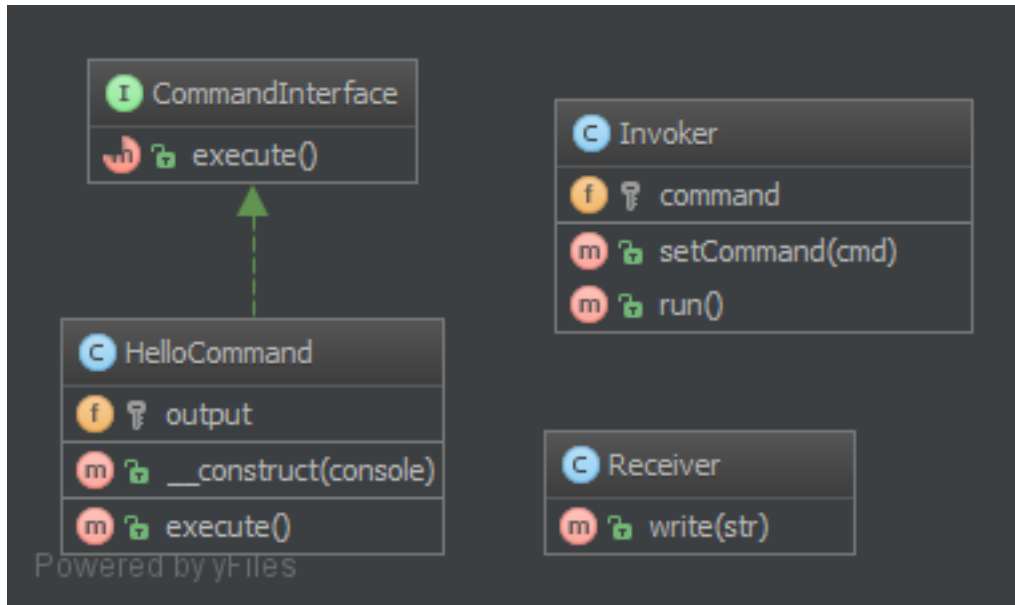

The second aspect of this pattern is the `undo()`, which undoes the method `execute()`. Command can also be aggregated to combine more complex commands with minimum copy-paste and relying on composition over inheritance.

Examples

- A text editor : all events are Command which can be undone, stacked and saved.
- Symfony2: SF2 Commands that can be run from the CLI are built with just the Command pattern in mind

- big CLI tools use subcommands to distribute various tasks and pack them in “modules”, each of these can be implemented with the Command pattern (e.g. vagrant)

7  use DesignPatterns\Behavioral\Command\Receiver;
8
9  class CommandTest extends \PHPUnit_Framework_TestCase
10 {
11     public function testInvocation()
12     {
13         $invoker = new Invoker();
14         $receiver = new Receiver();
15
16         $invoker->setCommand(new HelloCommand($receiver));
17         $invoker->run();
18         $this->assertEquals($receiver->getOutput(), 'Hello World');
19     }
20 }
```

1.3.3 Iterator

Purpose

To make an object iterable and to make it appear like a collection of objects.

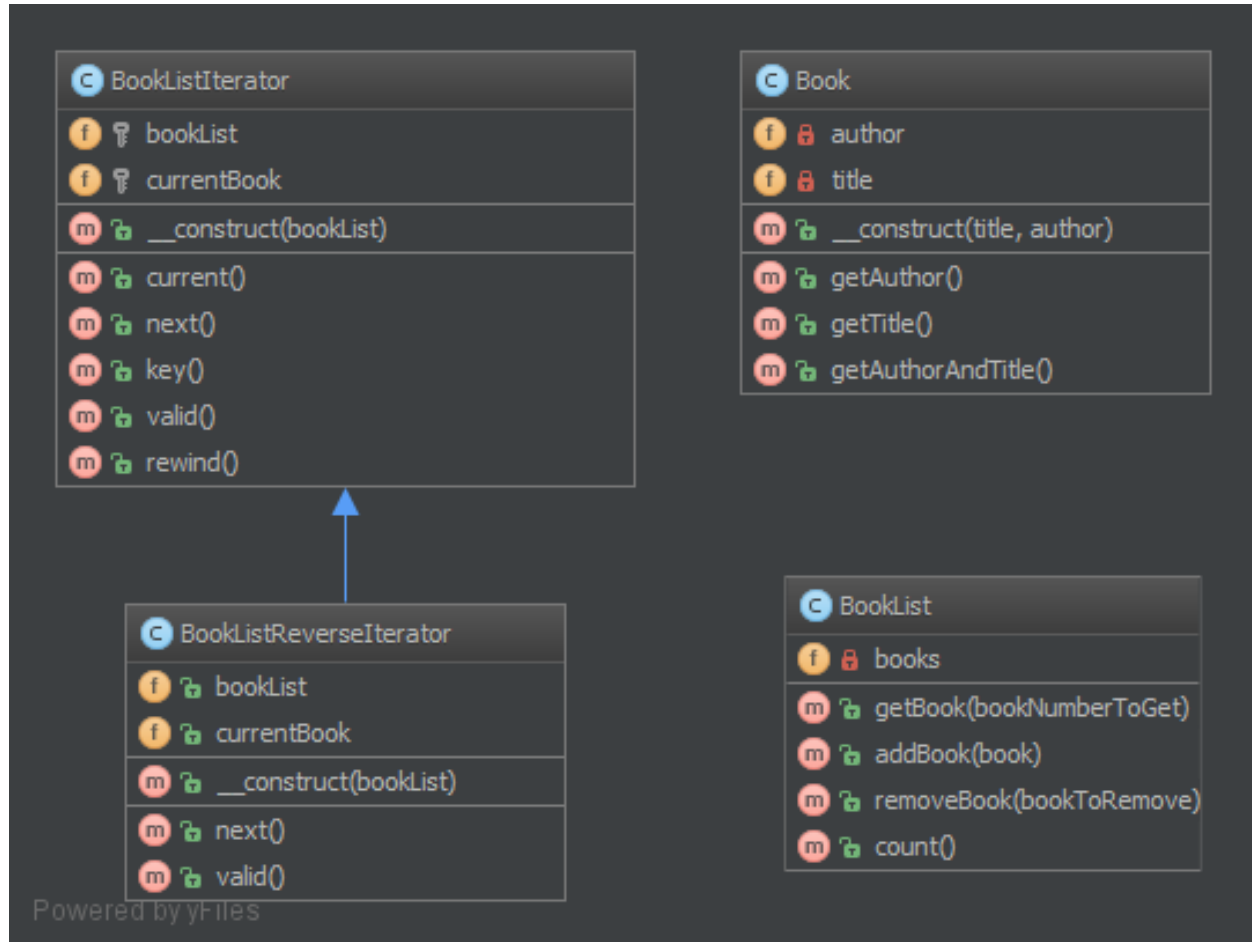

Examples

- to process a file line by line by just running over all lines (which have an object representation) for a file (which of course is an object, too)

Note

Standard PHP Library (SPL) defines an interface Iterator which is best suited for this! Often you would want to implement the Countable interface too, to allow `count($object)` on your iterable object

75     }
76 }
```

1.3.4 Mediator

Purpose

This pattern provides an easy way to decouple many components working together. It is a good alternative to Observer IF you have a “central intelligence”, like a controller (but not in the sense of the MVC).

All components (called Colleague) are only coupled to the MediatorInterface and it is a good thing because in OOP, one good friend is better than many. This is the key-feature of this pattern.

16
17     $this->expectOutputString('Hello World');
18     $client->request();
19 }
20 }
```

1.3.5 Memento

Purpose

It provides the ability to restore an object to its previous state (undo via rollback) or to gain access to state of the object, without revealing its implementation (i.e., the object is not required to have a function to return the current state).

The memento pattern is implemented with three objects: the Originator, a Caretaker and a Memento.

Memento – an object that *contains a concrete unique snapshot of state* of any object or resource: string, number, array, an instance of class and so on. The uniqueness in this case does not imply the prohibition existence of similar states in different snapshots. That means the state can be extracted as the independent clone. Any object stored in the Memento should be *a full copy of the original object rather than a reference* to the original object. The Memento object is a “opaque object” (the object that no one can or should change).

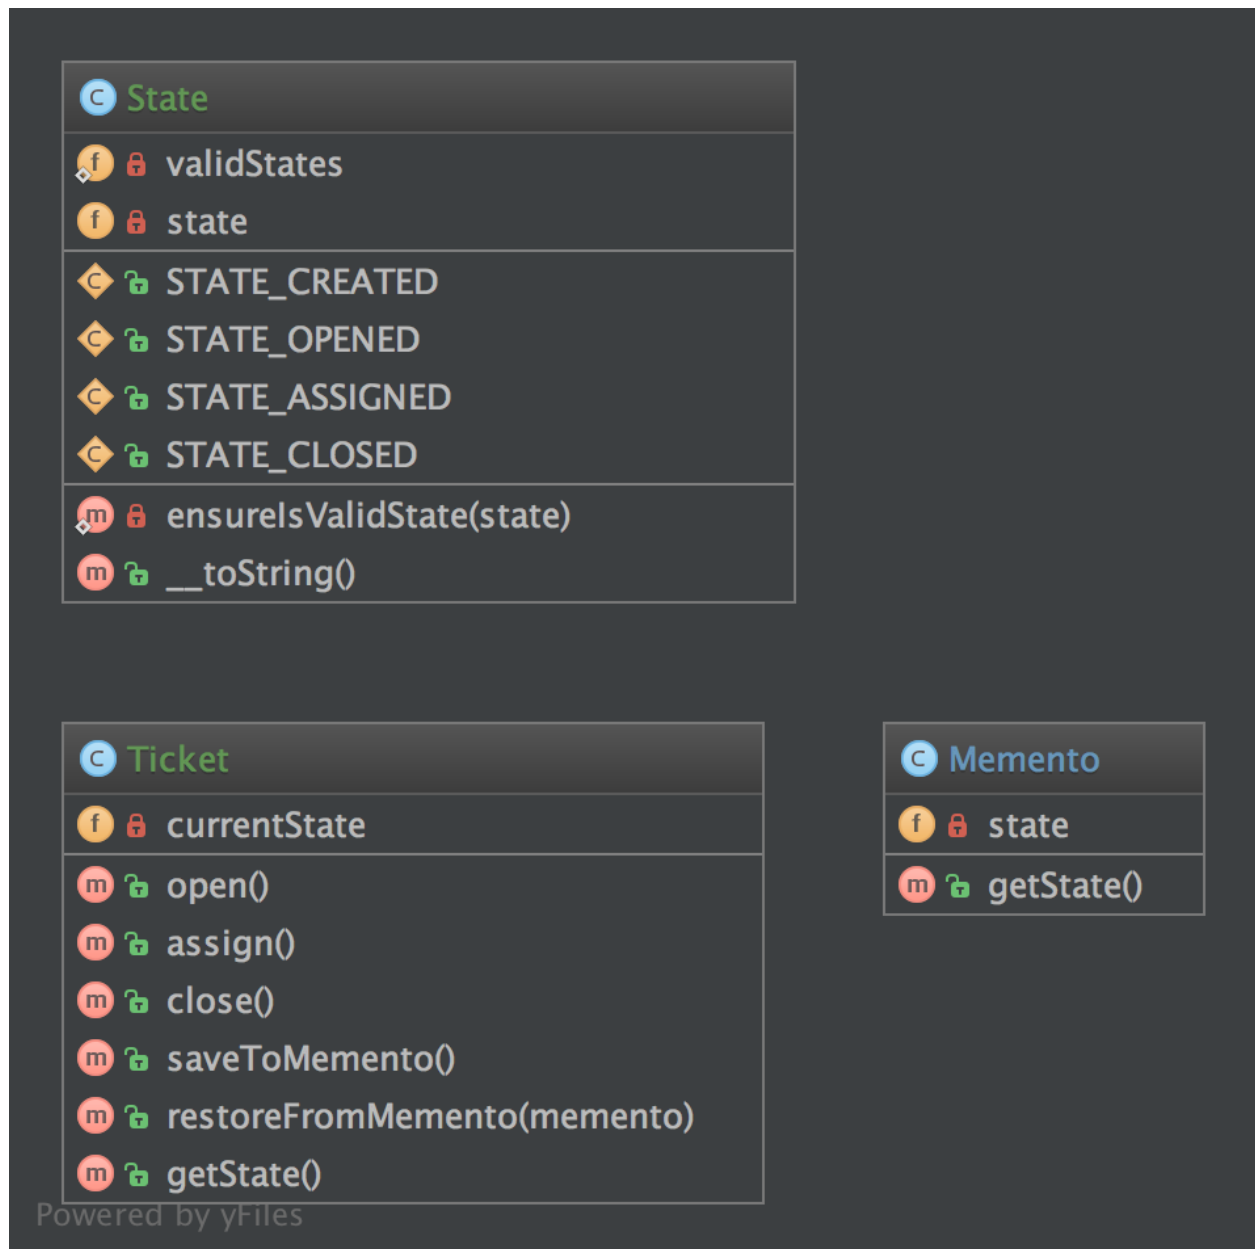

Originator – it is an object that contains the *actual state of an external object is strictly specified type*. Originator is able to create a unique copy of this state and return it wrapped in a Memento. The Originator does not know the history of changes. You can set a concrete state to Originator from the outside, which will be considered as actual. The Originator must make sure that given state corresponds the allowed type of object. Originator may (but not should) have any methods, but they *they can't make changes to the saved object state*.

Caretaker *controls the states history*. He may make changes to an object; take a decision to save the state of an external object in the Originator; ask from the Originator snapshot of the current state; or set the Originator state to equivalence with some snapshot from history.

Examples

- The seed of a pseudorandom number generator
- The state in a finite state machine
- Control for intermediate states of [ORM Model](#) before saving

29         $this->assertNotSame($openedState, $ticket->getState());
30     }
31 }
```

1.3.6 Null Object

Purpose

NullObject is not a GoF design pattern but a schema which appears frequently enough to be considered a pattern. It has the following benefits:

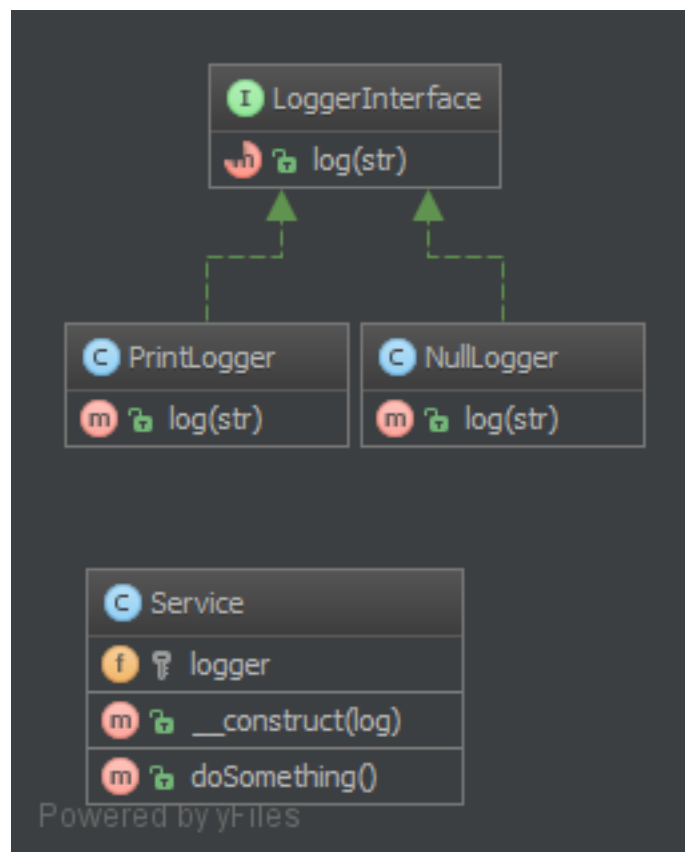

- Client code is simplified
- Reduces the chance of null pointer exceptions
- Fewer conditionals require less test cases

Methods that return an object or null should instead return an object or NullObject. NullObjects simplify boilerplate code such as `if (!is_null($obj)) { $obj->callSomething(); }` to just `$obj->callSomething();` by eliminating the conditional check in client code.

Examples

- Symfony2: null logger of profiler
- Symfony2: null output in Symfony/Console
- null handler in a Chain of Responsibilities pattern
- null command in a Command pattern

22         $service->doSomething();
23     }
24 }

```

1.3.7 Observer

Purpose

To implement a publish/subscribe behaviour to an object, whenever a “Subject” object changes its state, the attached “Observers” will be notified. It is used to shorten the amount of coupled objects and uses loose coupling instead.

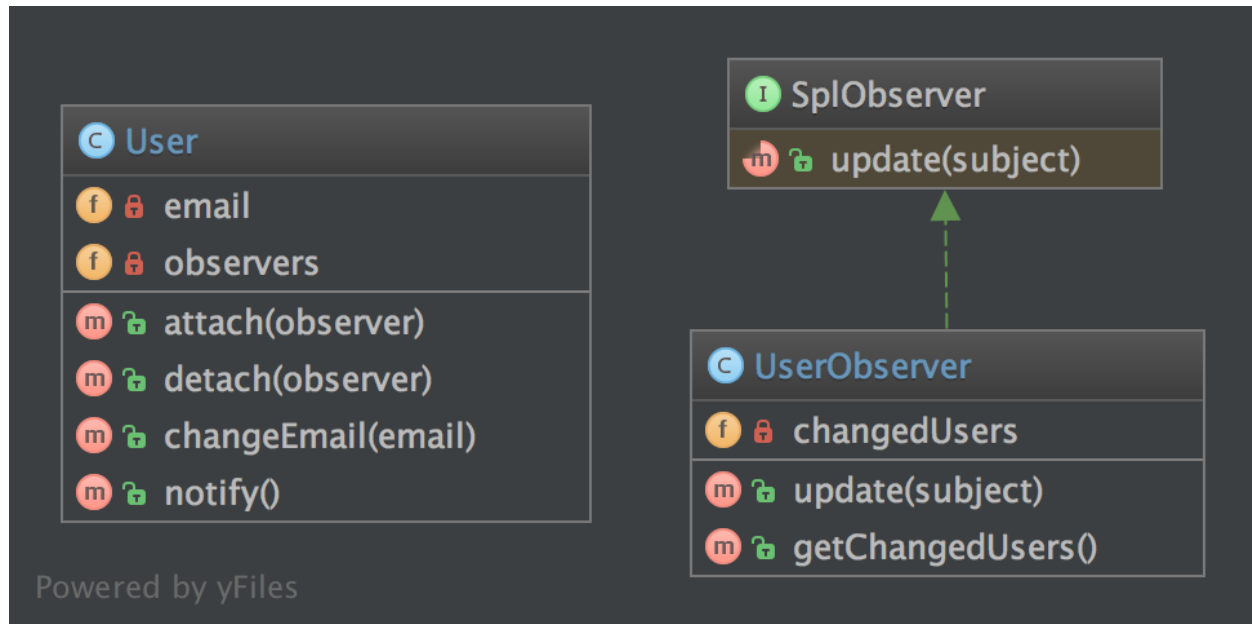

Examples

- a message queue system is observed to show the progress of a job in a GUI

Note

PHP already defines two interfaces that can help to implement this pattern: SplObserver and SplSubject.

10     public function testChangeInUserLeadsToUserObserverBeingNotified()
11     {
12         $observer = new UserObserver();
13
14         $user = new User();
15         $user->attach($observer);
16
17         $user->changeEmail('foo@bar.com');
18         $this->assertCount(1, $observer->getChangedUsers());
19     }
20 }
```

1.3.8 Specification

Purpose

Builds a clear specification of business rules, where objects can be checked against. The composite specification class has one method called `isSatisfiedBy` that returns either true or false depending on whether the given object satisfies the specification.

```

1.3.9 State

Purpose

Encapsulate varying behavior for the same routine based on an object's state. This can be a cleaner way for an object to change its behavior at runtime without resorting to large monolithic conditional statements.

Test

1.3.10 Strategy

Terminology:

- Context
- Strategy
- Concrete Strategy

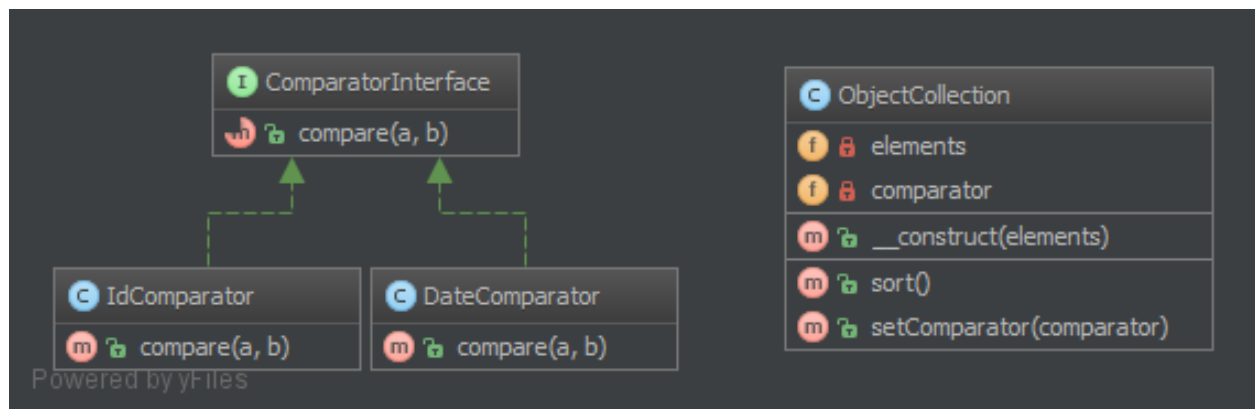

Purpose

To separate strategies and to enable fast switching between them. Also this pattern is a good alternative to inheritance (instead of having an abstract class that is extended).

Examples

- sorting a list of objects, one strategy by date, the other by id
- simplify unit testing: e.g. switching between file and in-memory storage

68     $this->assertEquals($expected, $firstElement);
69 }
70 }
```

1.3.11 Template Method

Purpose

Template Method is a behavioral design pattern.

Perhaps you have encountered it many times already. The idea is to let subclasses of this abstract template “finish” the behavior of an algorithm.

A.k.a the “Hollywood principle”: “Don’t call us, we call you.” This class is not called by subclasses but the inverse. How? With abstraction of course.

In other words, this is a skeleton of algorithm, well-suited for framework libraries. The user has just to implement one method and the superclass do the job.

It is an easy way to decouple concrete classes and reduce copy-paste, that’s why you’ll find it everywhere.

36  }
```

1.3.12 Visitor

Purpose

The Visitor Pattern lets you outsource operations on objects to other objects. The main reason to do this is to keep a separation of concerns. But classes have to define a contract to allow visitors (the `Role::accept` method in the example).

The contract is an abstract class but you can have also a clean interface. In that case, each Visitor has to choose itself which method to invoke on the visitor.

UML Diagram

Code

You can also find these code on [GitHub](#)

RoleVisitorInterface.php

```

1  <?php
2
3  namespace DesignPatterns\Behavioral\Visitor;
4
5  /**
6   * Note: the visitor must not choose itself which method to
7   * invoke, it is the Visitee that make this decision
8   */
9  interface RoleVisitorInterface
10 {
11     public function visitUser(User $role);
12
13     public function visitGroup(Group $role);
14 }
  
```

RoleVisitor.php

```

1  <?php
2
3  namespace DesignPatterns\Behavioral\Visitor;
4
5  class RoleVisitor implements RoleVisitorInterface
6  {
7      /**
8       * @var Role[]
9       */
10     private $visited = [];
11
12     public function visitGroup(Group $role)
13     {
14         $this->visited[] = $role;
15     }
16 }
  
```

```
15     }
16
17     public function visitUser(User $role)
18     {
19         $this->visited[] = $role;
20     }
21
22     /**
23      * @return Role[]
24      */
25     public function getVisited(): array
26     {
27         return $this->visited;
28     }
29 }
```

Role.php

31   */
32  public function testVisitSomeRole(Visitor\Role $role)
33  {
34      $role->accept($this->visitor);
35      $this->assertSame($role, $this->visitor->getVisited()[0]);
36  }
37 }
```

1.4 More

1.4.1 Delegation

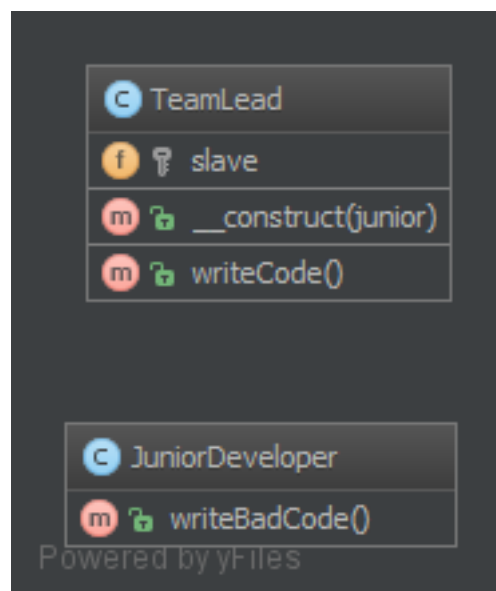

Purpose

Demonstrate the Delegator pattern, where an object, instead of performing one of its stated tasks, delegates that task to an associated helper object. In this case TeamLead professes to writeCode and Usage uses this, while TeamLead delegates writeCode to JuniorDeveloper's writeBadCode function. This inverts the responsibility so that Usage is unknowingly executing writeBadCode.

Examples

Please review JuniorDeveloper.php, TeamLead.php, and then Usage.php to see it all tied together.

UML Diagram

Code

You can also find these code on [GitHub](#)

TeamLead.php

```

1  <?php
2
3  namespace DesignPatterns\More\Delegation;
4
5  class TeamLead
6  {
7      /**
8       * @var JuniorDeveloper
9       */
10     private $junior;
11
12     /**
13      * @param JuniorDeveloper $junior
14      */
15     public function __construct(JuniorDeveloper $junior)
16     {
17         $this->junior = $junior;
18     }
19
20     public function writeCode(): string
21     {
22         return $this->junior->writeBadCode();
23     }
24 }
```

JuniorDeveloper.php

```

1  <?php
2
3  namespace DesignPatterns\More\Delegation;
4
5  class JuniorDeveloper
6  {
7      public function writeBadCode(): string
8      {
9          return 'Some junior developer generated code...';
10     }
11 }
```

Test

Tests/DelegationTest.php

```

1  <?php
2
3  namespace DesignPatterns\More\Delegation\Tests;
4
5  use DesignPatterns\More\Delegation;
6
7  class DelegationTest extends \PHPUnit_Framework_TestCase
8  {
9      public function testHowTeamLeadWriteCode()
```

```
10 {  
11     $junior = new Delegation\JuniorDeveloper();  
12     $teamLead = new Delegation\TeamLead($junior);  
13  
14     $this->assertEquals($junior->writeBadCode(), $teamLead->writeCode());  
15 }  
16 }
```

1.4.2 Service Locator

THIS IS CONSIDERED TO BE AN ANTI-PATTERN!

Service Locator is considered for some people an anti-pattern. It violates the Dependency Inversion principle. Service Locator hides class' dependencies instead of exposing them as you would do using the Dependency Injection. In case of changes of those dependencies you risk to break the functionality of classes which are using them, making your system difficult to maintain.

Purpose

To implement a loosely coupled architecture in order to get better testable, maintainable and extendable code. DI pattern and Service Locator pattern are an implementation of the Inverse of Control pattern.

Usage

With `ServiceLocator` you can register a service for a given interface. By using the interface you can retrieve the service and use it in the classes of the application without knowing its implementation. You can configure and inject the Service Locator object on bootstrap.

Examples

- Zend Framework 2 uses Service Locator to create and share services used in the framework(i.e. EventManager, ModuleManager, all custom user services provided by modules, etc...)

33
34     $this->assertInstanceOf('DesignPatterns\More\ServiceLocator\LogService', $logger);
35 }
36 }
```

1.4.3 Repository

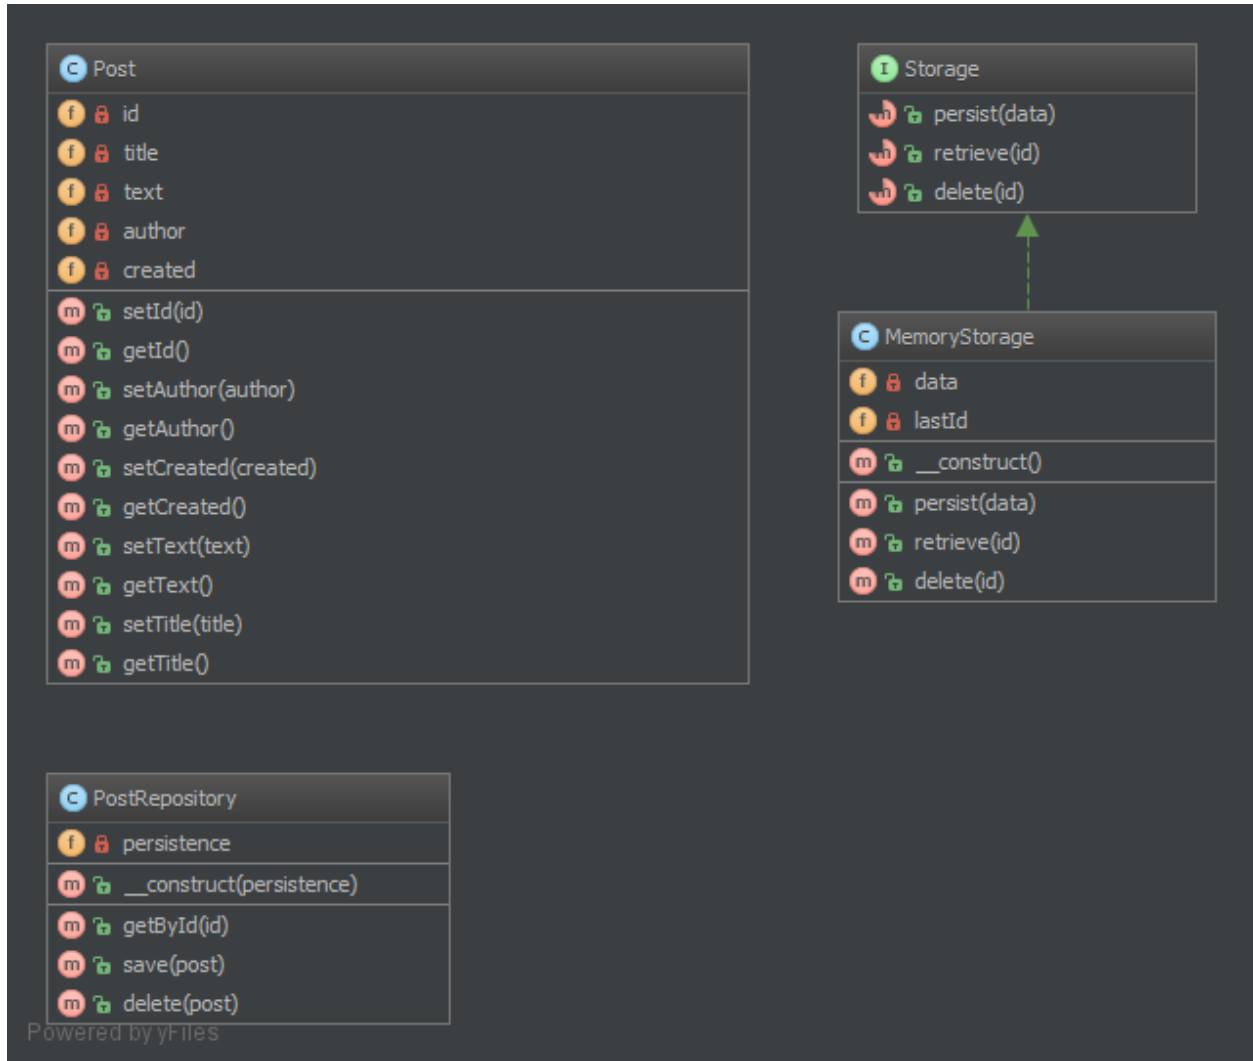

Purpose

Mediates between the domain and data mapping layers using a collection-like interface for accessing domain objects. Repository encapsulates the set of objects persisted in a data store and the operations performed over them, providing a more object-oriented view of the persistence layer. Repository also supports the objective of achieving a clean separation and one-way dependency between the domain and data mapping layers.

Examples

- Doctrine 2 ORM: there is Repository that mediates between Entity and DBAL and contains methods to retrieve objects
- Laravel Framework

6 use DesignPatterns\More\Repository\Post;
7 use DesignPatterns\More\Repository\PostRepository;
8
9 class Repository extends \PHPUnit_Framework_TestCase
10 {
11     public function testCanPersistAndFindPost()
12     {
13         $repository = new PostRepository(new MemoryStorage());
14         $post = new Post(null, 'Repository Pattern', 'Design Patterns PHP');
15
16         $repository->save($post);
17
18         $this->assertEquals(1, $post->getId());
19         $this->assertEquals($post->getId(), $repository->findById(1)->getId());
20     }
21 }
```

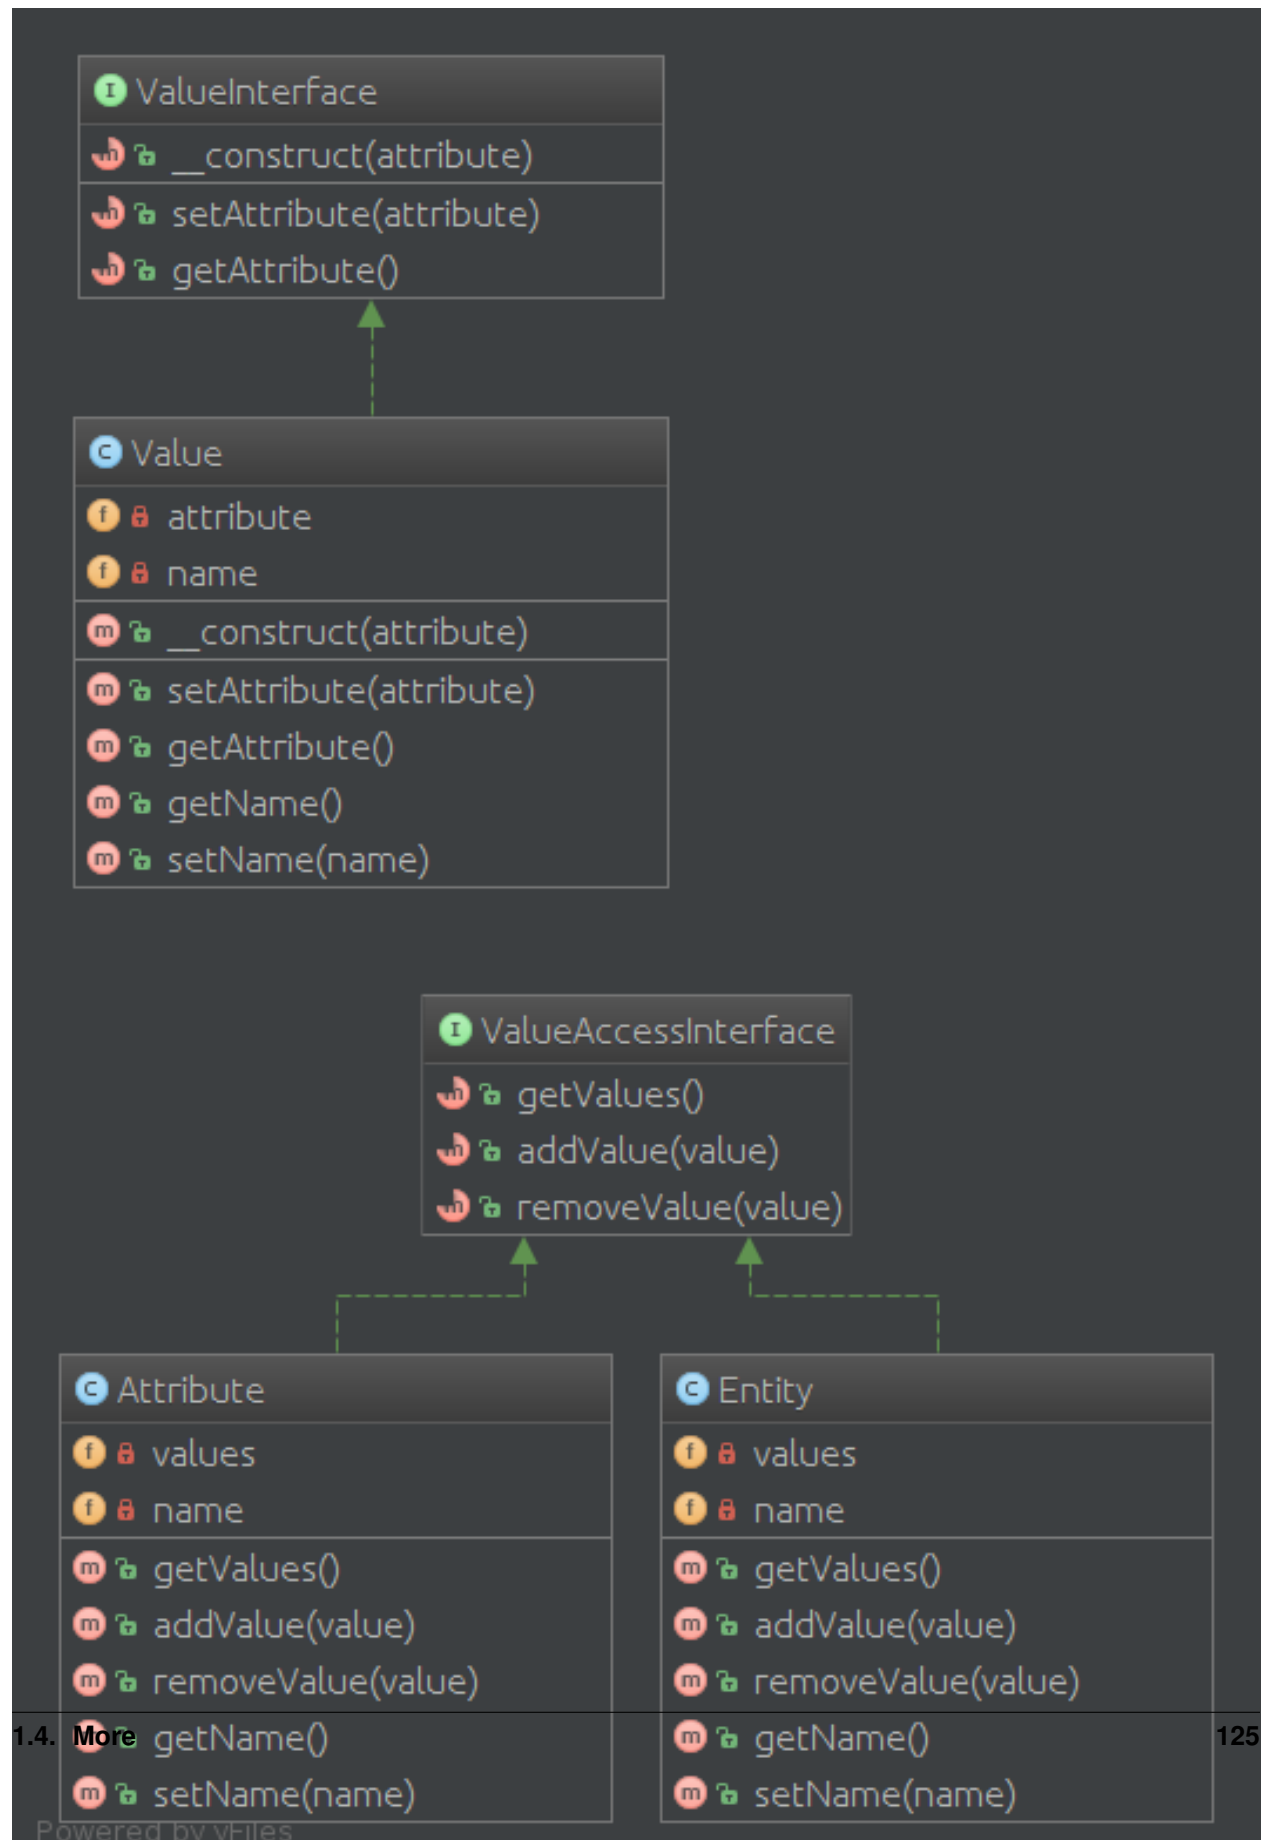

1.4.4 Entity-Attribute-Value (EAV)

The Entity–attribute–value (EAV) pattern in order to implement EAV model with PHP.

Purpose

The Entity–attribute–value (EAV) model is a data model to describe entities where the number of attributes (properties, parameters) that can be used to describe them is potentially vast, but the number that will actually apply to a given entity is relatively modest.
